Meigu County Yi Tone

Andy Eatough

Meigu County,¹ in the southern part of China's Sichuan Province, is primarily inhabited by people who are known in Chinese as Yi [ji³⁵] or Yizu [ji³⁵tsu³⁵], and in their own language as Nosu [nɔ³³su³³]. The dialects of the Yi are Tibeto-Burman, and belong to the Loloish subgroup of Lolo-Burmese. Those Loloish dialects which are spoken by people officially considered to be Yi are usually divided into 6 major dialect groupings. The northernmost of these 6 groupings is called Northern Yi or Liangshan Yi. The speech variety of Meigu County is classified as part of the ɛ₁³³nɔ³³ dialect of Liangshan Yi.

The data was collected by the author in 1995 and 1996, primarily from a bilingual speaker in her 20s who grew up near the town of Bapu, the seat of government for Meigu County. She speaks Yi with some of her friends and with family members, some of whom are monolingual in Yi. A male speaker in his 20s from Bapu was also consulted.

The syllable structure is (C)V. The consonant and vowel inventories are given in Figure 1 and Figure 2 respectively.

There are three contrastive tones. One of these has three allophones, which are conditioned by the preceding tone. Tonal allophony is illustrated in the first data set.

There is also some tonal allomorphy. The second data set illustrates a rule which applies to nominal compounds and affects the tone of the first noun root. The third data set illustrates another rule which applies in number + classifier compounds and affects the tone of the classifier.²

¹ Meigu County is in Liangshan Prefecture, and is one of the most inaccessible and traditional of the counties in Liangshan. More than 96% of the county's population is Yi, according to official statistics. The County did not exist before liberation, since during the Republic of China period the only ethnic Chinese in the area were slaves of the Yi. Naturally, use of the Yi language is very vigorous among all ages in the Yi villages of the county, especially outside of the county seat, the town of Bapu.

² Cross-dialectic comparison suggests that this rule may have a wider application than just number plus classifier compounds. Most nominal compounds which, based on cross-dialectic comparison, would be expected to have the tones 31 + 45, have 31 + 31, e.g. nɔ³¹sj³¹ eye, rather than the expected nɔ³¹sj⁴⁵.
