ABSTRACT

This thesis argues against a nominal classification analysis of orientation verbs in Damana, a Chibchan language of northern Colombia. As shown through a careful analysis of eleven verbs, the verbal system of Damana primarily encodes spatial relations and does not classify objects by shape.

The evidence for this conclusion proceeds from several areas. First, I show that Damana does not meet the requirements for a noun class system. Secondly, I show that the same object can be freely associated with various verb stems depending on the object's orientation. Thirdly, in metaphorical extensions involving these 'noun class' verbs, it is a spatial relation which is extended and not shape, illustrating the core meaning or sense of the verb. Finally, other verbs are given that describe additional spatial relations, yet have a lexical form which is independent of an object's shape. These verbs are used freely in metaphorical extensions in ways similar to the 'noun class' verbs, forming a natural group of verbs that encode spatial relations as part of the verb's lexical meaning. Because the arguments include extensive discussion of metaphorical extensions, this thesis provides a glimpse into the rich semantic system of Damana.

LIST OF ABBREVIATIONS[1]

1p	first person plural
1s	first person singular
2p	second person plural
2s	second person singular
3p	third person plural
3s	third person singular
Advzr	adverbializer
Actvzr	activizer
Ben	benefactive
Caus	causative
CK	common knowledge
Cont	continuative
DefLoc	definite location
Dim	diminutive
DO*	direct object agreement
DOR	direct object reflexive
Erg	ergative
Emph	emphatic
FP*	foregrounded past
Fut*	future
Ger	gerund
Hor	hortatory
IF	interrogative focus
Imn	imminent
Imp*	imperative
Impf	imperfective
Incp	inceptive
IndefFut	indefinite future
IndefLoc	indefinite location

---

[1]Some of the abbreviations used for the underlying morphemes do not agree with what appeared in C. Williams (1993). For ease in comparing the two works, the differences are: ADZ to Advzr, VBZ to Actvzr, ADV+BEN to Ben, INDFLOC to IndefLoc, DETR to OblR, POSRE to PossR, QS to Q and UNO to UnsO.

Inf	inform
InfW	inform with proof of witness
Intens	intensifier
IO*	indirect object
Lim	limitative
LN	locative nominalizer
Mal	malefactive
Medl	medial
NAP	negative agentless passive
Neg	negative
NegPfv	negative perfective
O*	object
Obg	obligation
Obl	oblique
OblR	oblique reflexive
ON	object nominalizer
Pfv	perfective
PIO	plural inanimate object
PL	plural
Por	portative
Poss	possessive
PossR	possessive reflexive
Prtc*	participle
Pur	purpose
Q	question
S*	subject
SO	shared orientation
Top	topic
UnsAg	unspecified agent
UnsO	unspecified object
Wit	witness
WO	without orientation

---

* Used in combination with glosses for person and number, e.g. '3pS'

CHAPTER 1
INTRODUCTION

Cultures are in some ways like living beings. They have a unity of their
own. They tend to persevere in their being, and their relationship to their
environment is vital.... These properties of a culture have their roots in the
collective identity of the people, the living human beings who, generation
after generation, find it expressed in their culture and above all, in its
system of ideas and values. (Dumont 1986:587 as quoted in Wierzbicka
1992:395)

The mountain range in northern Colombia known as the Sierra Nevada de Santa
Marta rises majestically out of the Caribbean Sea and reaches a height of about 15,000
feet. Inhabiting this mountain range are the descendents of the Tairona nation, an
advanced pre-Colombian civilization. These descendents, having resisted the
encroachment of the Spanish conquistadors, the Roman Catholic church, and the
predominant Colombian culture, continue living much in the same way as they have for
hundreds of years. However, the years of marginal contact since the Spanish invasion
have taken their toll. Of an estimated six or more distinct indigenous groups (Reichel-
Dolmatoff 1953:17-31), only three remain: the Arhuaco, the Kogi, and the Wiwa.

To the Wiwa, who live in this vast mountain range, shapes and spatial relations
are important concepts. The geographical area is mountainous with sharp ridges, pointed
peaks, deep valleys, and snow caps. The people live scattered over the mountain range,
separated by ridges but connected by steep mountain trails that crisscross the whole area.
The mountainous topography may be reflected linguistically in the verbal aspectual

1

system (see Chapter 5). 'One might say that the structural concepts, from dualism to the construction of sacred space, are based essentially on the empirical observation of nature' (Reichel-Dolmatoff 1974:300).

From the empirical observation of nature, shapes and spatial relations are then categorized. It is through categorization that humans are able to reduce the 'limitless variation in the world to manageable proportions' (Taylor 1989:50). In other words, categorization is primarily a method for understanding the world, and to understand how the people in a language group categorize is to understand, at least in part, how they think. The purpose of this paper is to examine one aspect of the verbal categorization system of Damana,[1] the language of the Wiwa people. An understanding of how this system of categorization is reflected in their language affords a glimpse into how the Wiwa view the world around them.

One aspect of the verbal system in Damana is that there is a set of existence/placement verbs with distinct lexical forms which appear to depend on the physical shape of the object involved. In other languages, this phenomenon has been described as a nominal classification system (Dixon 1982, Carter 1976, Frank 1990). This traditional view fails to take into account the importance of the overall categorization process, and thus is too narrow in its scope. By examining the metaphorical extensions of these verb forms, I intend to illustrate that verb selection is a reflection of the Wiwa's system of spatial organization which is encoded in the semantics of the verbs themselves.

First, some preliminary facts about the verbal system of Damana as well as some morphological background are given. Stative verbs in Damana form a large portion of

---

[1]I have chosen to write Damana with /a/'s because this is the spelling used by Trillos (1989) and is the form being utilized in Colombia. In C. Williams (1993) the language name appears with the first two vowels being schwas.

the verbal inventory. Inherently transitive verbs are rare; the vast majority of transitive verbs are derived from stative verb stems by one of the following strategies: (1) the addition of -shi 'causative' (Caus) or (2) perfective aspect in combination with u 'do' and/or (3) an overt noun phrase marked with ergative case. The word class of adjective is quite small if only underived stems are considered[2], but the formation of adjectives from verbal stems is quite productive.

Frank (1990) describes what he calls a noun classification system in the related language Ika[3] in which the shapes long, flat, three-dimensional, liquid, holders, and upright are distinguished. G. Reichel-Dolmatoff (1950) however claims that the people groups of the Sierra Nevada perceive the world in terms of spatial orientation, specifically with reference to North, South, East, West, Zenith, Nadir, and Center. This suggests that the choice of verb might be determined not by the shape of an object, but rather its orientation with respect to these seven points of reference. As we shall see, orientation is just as important as shape in Damana. (This can also be seen in Frank's category 'upright'.)

Some of the spatial relation verbs[4] in Damana are listed in Table 1 along with their associated classification according to the above two systems. The classifications listed under ' Following Reichel-Dolmatoff' are based on his interpretation of the primary spatial orientations in the culture although he doesn't provide an analysis for these verbs.

---

[2]Mithun (1988) says that many North American languages lack a special lexical class of adjective.
[3]Ika or Ikan is the name of the language spoken by the Arhuaco.
[4]These were referred to in C. Williams (1993) as orientation verbs.

Table 1:   **Verbs which encode spatial relations**

Damana Verb	Corresponding Category in Ika (Frank)	Damana Gloss	Characterization Following Reichel-Dolmatoff
te	upright	(be) upright	Zenith-Nadir
gag	long	(be) horizontal	North-South East-West
pa	flat	(be) flat	North-South-East-West plane
du	—	(be) without orientation	non-oriented
zhu	—	(be) distributed	—
zu	liquid	pour	—

The verb te is used most often with containers or solid objects that have a discernable base. A glass that is upright, a person who is standing, or a pot are all commonly cited objects with this verb. I use the gloss '(be) upright' for te.

(1)   kungumaka   buku te   ushi[5]
        kunguma -ka buku te   u -shi
        earth   -at pot   upright do -Caus

        'Put the pot on the ground!'

(Damana examples in this thesis are presented in a four-line interlinear format. Line 1, the raw text, is written in a proposed practical orthography. Line 2 generally shows the underlying morphemes, although some examples have morphemes lumped together and glossed as a unit on line 2 for clarity in illustrating the particular extension.

---

[5]The verb u 'do' is functioning as an auxiliary to attach the causative suffix -shi.

In these cases, the full morphemic analysis is provided in the discussion. In line 3, the morphemes are glossed, followed by a free translation in line 4.)

Stick-like objects such as people lying down and pieces of wood are the objects most often referenced with **gag** '(be) horizontal' (horiz).

(2)   kungumaka   kun   gaga[6]   ushí
           kunguma -ka kun   gag   u -shi
           earth   -at wood horiz do -Caus

'Put the wood on the ground!'

For books, papers, large leaves, and lids to containers, the associated verb is **pa** '(be) flat'.

(3)   kungumaka   zhinzhoma pa ushí
           kunguma -ka zhinzhoma pa u -shi
           earth   -at book   flat do -Caus

'Put the book on the ground!'

Du, '(be) without orientation' (WO), is used with objects that are flexible, such as objects made of fabric.

(4)   kungumaka   dwadu dwa[7] ushi
           kunguma -ka duadu du   u -shi
           earth   -at bag   WO do -Caus

'Put down the woven bag!'

The last two classifications also introduce an element of substance into the system. **Zhu** '(be) distributed' (distr) in Damana is similiar to the classification of 'granular mass' found in Athapaskan classification (Dixon 1982). The most common objects that exist in mass in the culture are sand, corn and salt.

---

[6]I claim that the final /a/ in **gaga** is epenthetic. It is my understanding that verbs in Damana are optimally bimoraic. An analysis of the phonology has not been completed, however, it seems apparent that /a/ is the default vowel.

[7]I claim that the final /a/ in **dwa** is also epenthetic as in **gaga** above.

(5)   rema nʉngu inzhu   ushi
          rema nʉngu i-   zhu u -shi
          meat salt   upon- distr do -Caus

          'Put salt on the meat.'

Finally, **zu** 'pour' is the verb used with a liquid. **Zu** is not discussed in future chapters because I believe that it means simply 'pour' and does not appear to be used in metaphor.

(6)   dzhira inzu   ushí
          dzhira i-   zu   u -shi
          water upon- pour do -Caus

          'Pour some water over (the food to cook it).'

Locative prefixes frequently occur with this set of verbs. These include: **i-** 'upon', **a-** 'in', and **kʉ-** 'at'. Formally, **i-** 'upon' would be defined as locating an object x upon a second object y where x is contiguous with a surface of y, and y supports x.

(7)   dukʉnamba nite   ushí
          dukʉna-ba nʉ- i-   te   u -shi
          leg   -Obl 1sDO- upon- upright do -Caus

          'Put it upright in my lap.'

A formal definition of **a-** 'in' would state that x is smaller than and located internal to y.

(8)   sutamba   até   nayá   nʉnkwá
          suta   -ba a- te   nai -á   nʉn -kuá
          smoke -Obl in-upright go -Pfv be -FP

          'Standing in the (midst of the) smoke he left.'

If x is near or in y, where x is portable relative to y and y is not a geographical area, **kʉ-** 'at' is used.

(9)   muramba   raga   uritena   kuteshi   awungashka
           mura -ba   ra -ga   zhi- tena ku- te   -shi   -i   u -unga -ashka
           mule -Obl 1s -Erg Poss- side at- upright-Caus -Ger do -1sFut-when

           makaru   uritena   kute   ushi
           ma -ka -ru   zhi- tena ku- te   u -shi
           2s -Erg -Top Poss- side at- upright do -Caus

           'While I am putting (coffee) on this side of the mule, you put (coffee) on the other side of the mule.'

When y is a geographical area and solid objects are scattered about on the ground, the verb te is prefixed with un- 'indefinite location' (IndefLoc).

(10)   turuma zhanduna unteshawa   shigi   agunga
           turuma zhanduna un-   te   -shi -aua   shigi   ag -unga
           potato seed   IndefLoc-upright-Caus-2pImp tomorrow plant -1sFut

           'You all toss the seed potatoes out on the ground (to dry), I will plant them tomorrow.'

In order to support my claim that Damana does not have a noun class system, chapters 2 through 6 develop arguments that what these verbs encode are spatial relations as part of their semantic meaning. Chapter 2 shows that Damana fails to meet the requirements of a nominal classification system as defined by Dixon (1982) and Allan (1977). Chapter 3 shows the noun class analysis also fails to account for examples involving neutralization (i.e. loss of object class in verb selection). Chapter 4 summarizes spatial perception in humans and the use of metaphor in extending spatial relations, providing background information for Chapters 5 and 6. Chapter 5 illustrates that it is the spatial relationship encoded in the verb and not the physical shape of an object which is extended by metaphor. Finally, Chapter 6 shows that there exist in Damana other verbs for which there are no associated objects, yet these verbs exhibit the same types of spatial extensions as the 'noun class' verbs, further bolstering the argument that it is spatial relations, and not inherent properties of objects like shape, which are central in the system.

CHAPTER 2
NOMINAL CLASSIFICATION SYSTEMS

The first question to ask about Damana is 'Does Damana in fact exhibit a noun class system, or any other system of nominal classification?' In the relevant literature, nominal classification systems are analyzed and compared according to the number of nominal classes, how rigid ('classical') the classes are, whether or not all the nouns are categorized, how the noun class is referenced in the clause, and finally, how grammaticalized or semantically motivated the classes are. Aside from gender systems, all systems of nominal classification share a common set of semantic categorization principles based on man's social, physical, and functional interaction with the objects of their environment (Craig 1986). Before discussing how the verbal system in Damana compares with nominal classification systems, several languages or systems of classification are discussed below to illustrate clear cases of nominal classification.

Gender systems, which are the most familiar nominal classification systems for western linguists, appear to be based primarily on animacy and sex. There are prototypically a small number of classes with a high degree of rigidity, and usually all nouns are classified. They are referenced close to the head noun, forming a morphological unit with it, and are highly grammaticalized. In systems with only two noun classes, certain classifications may appear to be quite arbitrary. For example, the nouns that would be classified as inanimate or 'neuter' in a three-way system are distributed between 'masculine' and 'feminine' genders in Romance languages. This distribution is not based to any great extent on any semantic factor (Dixon 1982).

8

Swahili, a Bantu language, has eight classes, based primarily on inanimate things, non-human living things, human things, and things that occur in quantity. The classes are fairly rigid, and, excluding the human class, it has been difficult to propose a strong semantic basis for the classification.[1] In the following example, **vi-** is the plural inanimate object (PIO) classifier. The noun class is referenced on the head noun, the verb and any modifiers of the head noun in a concordial system. Example (11) is taken from Dixon (1982:161).

(11) vikombe   vidogo   viwili   vimevunjika
      vi- kombe   vi- dogo   vi- wili   vi- mevunjika
      PIO- cup   PIO- small   PIO- two   PIO- be.broken

'The two small cups are broken.'

In Japanese, there are 200-300 different classes or classfiers (Downing 1986). The choice of classifier which is often fixed by convention creates rigid classes with few nouns being able to be used with more than one classifier. Not all nouns are obligatorily classified. The classifers are free forms forming a morphological unit with the numeral or deictic. They typically do not bear any information about the semantic nature of the referents that is not provided by the referent itself (Downing 1986). In contrast to noun class indicators, these free form classifiers can be used anaphorically. To an English speaker, this system of classification seems redundant, because glossing yields expressions such as 'four round-things of oranges' or 'six long-things of trees'.

Navajo, an Athapaskan language, has twelve classes (Hoijer 1963). The classes are based mainly on shape (round, long, fabric-like, bulky, rigid, mass, and etc.). This system is different from the previous ones in that the nominal classification is encoded only on the verb, and is described by Allan (1977) as a predicate classifier system. The

---

[1]Denny and Creider (1986), however, have recently proposed a strong semantic basis for Proto-Bantu, but it has not yet been determined how much of this system is still operative in present day Bantu languages.

encoding involves suppletive verb stems which reference both the verbal event and a

classifying characteristic of an associated entity which is typically the absolutive of the

verb (subject of an intransitive, or object of a transitive). The coding describes the shape

of concrete objects which are (1) at rest, (2) in motion or being handled, (3) being

dropped or thrown, or (4) falling. The classes have a degree of flexibility as shown in

the following example, taken from Allan (1977).

> (12) bÃÃsÃ² sì'ã́
>   bÃÃsÃ² sì-   'ã́
>   money perfect- lie (of round entity)
>
> 'A coin is lying (there)'

> (13) bÃÃsÃ² sìnìl
>   bÃÃsÃ² sì-   nìl
>   money perfect- lie (of collection)
>
> 'Some money (small change) is lying (there).'

Allan (1977) notes that although the number of classes may vary greatly in

nominal classification systems (excluding gender systems), the semantics used for

classification appear to be generally based on the following six[2] categories: material,

shape, consistency, size, arrangement and quanta. The category material can be sub-

divided on the basis of animacy. Shape has subcategories of long, flat, and round,

sometimes referred to as one, two, and three-dimensional. In addition to these, there are

subcategories of non-dimensional shapes: prominent curved exterior, hollow, and

encircling. Consistency can be divided into flexible, hard or rigid, and non-discrete. Big

and small are subcategories of the category size. The category of arrangement classifies

objects: in some specific and non-inherent configuration (e.g. coil, loop, pleat), in a

specific position like 'objects in a row or parallel', in a specific non-inherent distribution

---

[2]Allan (1977) lists location as a category which would make seven categories, but the distribution of
this was limited to one language family, therefore I omit it.

(e.g. heap or clump). Some of the subcategories under quanta are number (e.g. dual), collection (e.g. bunch, cluster), volume (e.g. handful), instance (e.g. kind of, sort of), and partitives (e.g. piece of, sheet of).

Nominal classification systems are divided by some linguists between noun class systems and classifier languages. The terms noun class system and noun classifiers are used almost interchangeably in much of the literature, but both Dixon (1986) and Allan (1977) make a distinction between them. For the purposes of this paper, the distinction between them is not crucial since both are nominal classification systems, but because a distinction is made I will consider each one to show that Damana does not fit either description.

Dixon claims that with the great diversity in language and methods of classification, 'it may not be possible to find a common factor underlying every phenomenon that has been called noun classes (1982:160)'. In Dixon (1986), he proposes the following three criteria to define nominal classification. He considers it important to distinguish between noun classes and noun classifiers.

	Noun classes	Noun classifiers
a. number of classes	small and finite number	larger and more open
b. morphology	inflectional morphology	free lexical morphemes
c. grammatical use	obligatory and rule set (rigid)	discourse sensitive

Allan (1977: 285) defines a classifier as a 'surface morpheme' which 'denotes some salient perceived or imputed characteristic of the entity to which the associated noun refers'. His major criterion is the semantic input of the classifier. He excludes gender systems because he considers them to be semantically empty. Classifiers 'communicate a few especially important classes that objects fall into by virture of the

way we interact with them' (Denny 1976:125). Allan would allow more flexibility in the use of classifiers, in that a given noun may be used with more than one classifier.

The noun class or noun classifier system that is of particular interest for a study of Damana is the system found in the Athapaskan language family. The only area of the world known to have had this type of nominal classification, that of classifying verb stems, is in the western part of North America (Dixon 1982). Frank (1990), however, considers Ika, a language which is spoken by the Arhuaco of Northern Colombia and closely related to Damana, to have a noun class system similar to Athapaskan (as described by Dixon), with long, flat, three-dimensional, liquid, things with holders, and upright objects. He states that the physical shape of objects determines the choice of certain verbs or predicate nominals which may occur with those nouns. He considers the noun class system in Ika to be minimal, however, in that 'it involves only nouns referring to concrete objects and the noun classes are only relevant in locational sentences' (p. 53).

Since 1932, many linguists have shown an interest in the classificatory verbs of Athapaskan because they employ a predicate classifier system (Allan 1977). Dixon (1986) says that the Athapaskan system does not fall clearly into either a noun class system or a noun classifier system. Although there is a small set of classes (twelve in Navajo, nine in Chipewyan (Elford 1963), and ten in Dogrib (Davidson 1963)) in Athapaskan languages, the system of classification is quite limited in that only some of the nouns are classified and only on some semantic types of verbs. Dixon considers this system a combination of the two types of systems: 'Athapaskan classifying verb stems are unique in combining a major grammatical category of noun classes with semantic and distributional features that are characteristic of classifier sets' (Dixon 1982:224). Dixon (1982) claims, however, that the category of 'noun class' should be recognized for Athapaskan languages. Allan (1977) lists Athapaskan as a classifier language based upon his definition.

Damana, as shown in Table 1 (page 4), has a system similar to Ika where the choice of verb appears to be determined by the shape of the absolutive. The coding in Damana occurs only with concrete objects at rest or being handled. Like Ika, Damana does not have a limited set of noun classes into which all the nouns are grouped. If what is encoded in the verbs can be considered to be defining noun classes, the system is very flexible with the nominal being used with different stems depending on the verbal event. However, it is better to say that what is being encoded in the verb in Damana are not inherent properties of an object (like shape) which could create noun classes, but spatial relations and orientations. For example, a long (stick-like) object will be 'referenced' by a verb stem that supposedly classfies it, but in fact, it can only be used when it is in a certain orientation. I therefore contend that there is no true noun class system in either language.

The main question, then, is whether the system in Damana, like Athapaskan, classifies objects according to their physical shape (a salient, perceived characteristic of a nominal) and could be considered a classifier language. If the objects (long, flat, and upright) are placed in their prototypical orientations, the stems do seem to correspond to the shape of the object. However, there are some basic differences between the Athapaskan system of classification and the verbal system of Damana. As an example, the round class in Navajo utilizes four distinctive stems: one for a round object at rest, one for the placement of a round object, one for throwing a round object, and one for a round object falling. Compared to this, Damana has a very limited system. 'To throw' and 'to fall' do not have a classificatory verb stem. 'To put' and 'to be' are combined and referenced by the same stem. I contend for Damana that what is encoded in these spatial relation verbs are the orientations (e.g. lie, stand, sit) referring to the particular verbal events of 'to put' or 'to be'.

The spatial relations (upright, horizontal, flat, and without orientation) do not define inherent properties of nouns that could classify them although there exist certain shaped objects that are more prone to be associated with certain orientations. While noun-verb collocations give the appearance of classifying objects, co-occurrence constraints between nouns and predicates do not classify nouns. Therefore, Damana and Ika should not be considered as classifier languages.

Damana and Ika, like many North American languages, exhibit a concentration of morphological complexity within their verb forms. Mithun (1989) contends that languages with complex verbal morphological systems grammaticize different sets of semantic categories than those with well-developed nominal morphology. Rather than describing persons and objects, they describe aspects of events and states (p. 279).

A liquid occupies a position in a different way than a stick. People manipulate cloth in a different way than a many-pointed object. The classifier chosen does not depend on an inherent feature of the object, but on the way it moves or is handled (Mithun p.269).

I argue in this thesis that what is relevant in Damana is primarily orientation rather than shape. Forcing a noun class system on these languages creates classes such as 'things with holders' as mentioned above for Ika. By considering this to be a noun class, Frank is forced to restrict the holders in question to ones designed to contain a specific object. He lists the relationships of putting 'legs in pants', 'feet in shoes', and 'machete in sheath' as all referring to the noun class 'things with holders'. A far simpler approach would be to describe the verb as meaning 'to be inserted', and dispense with any special class of nouns.

In summary, Ika and Damana do not have a noun class system nor are they classifying languages. The nouns of these languages are not exhaustively grouped into a small number of classes. What is being encoded in the verb is not an inherent property

of a noun (that could define classes) but spatial relations and orientations. 'Noun classes' created by co-occurrence constraints between nouns and predicates do not constitute a classifier language.

Further arguments for this claim are offered in later chapters. In Chapter 3, verbs normally associated with objects of a certain shape are shown to occur freely with objects of other 'shapes'. In Chapters 5 and 6, metaphorical extensions of Damana verbs also support the claim that what is important in Damana is not the shape of an object per se, but rather its spatial relation with respect to its environment.

CHAPTER 3
FLEXIBLE USE OF NOUNS WITH VERBS APPROPRIATE
TO A DIFFERENT 'CLASS'

In a nominal classification system using classificatory verbs, the lexical choice of verb stem is based on some salient and perceived characteristic (e.g. shape, texture, etc.) of the absolutive NP. The purpose of this chapter is to illustrate that while each object has an inherent shape, it can be freely used with a verb stem associated with other shapes. This flexibility argues strongly against a nominal classification system.

There are many situations in which the perception of shape may vary. Lawrence (1977:97 as quoted in Mithun 1989) notes that 'some objects may be classified in more than one way, according to the object size, its spatial arrangement, or what part of the object is being specifically considered'. Verbs of placement may be further complicated by the additional features of 'sideways' versus 'rightside up'. The interaction of these different aspects of perception are illustrated in the following set of examples involving the placement of a glass. A glass in Damana is culturally considered to be an object with a discernable base which would normally have a vertical orientation. Under a nominal classification system, it would be assigned the verb te '(be) upright'.

(14) unaga   mesamba   azhimeta te   awín
      una -ga   mesa -ba   azhimeta te   u -in
      3s -Erg   table -Obl glass   upright/Pfv do -CK

'He set (put) the glass on the table.'   (normal vertical relationship)

However, if the glass is placed lengthwise on the table rather than rightside up, the verb form used is **gag** '(be) horizontal', not **te**.

(15) unaga   mesamba   azhimeta gagá   awín
      una -ga   mesa -ba   azhimeta gag -á u -in
      3s -Erg   table -Obl glass   horiz -Pfv do -CK

'He laid (put) the glass on the table.'   (sideways)

Finally, if the glass is placed upside down, the verb chosen is **pa** '(be) flat'

referring to the opening of the glass.

(16) unaga   mesamba   azhimeta pa   awín
      una -ga   mesa -ba   azhimeta pa -á   u -in
      3s -Erg   table -Obl glass   flat[1] -Pfv do -CK

'He put the glass on the table.'   (opening flat on table)

Nominal classification systems can be somewhat flexible in that when the focus is

on some specific characteristic of the referent or when the characteristics of the referent

are compatible with more than one classification, the same noun can be used with

different classifiers. In most nominal classification systems, however, there is a

relatively small number of nouns that can occur with markers from more than one class.

In cases when the verb chosen does not match up with the prototypical shape/orientation

of the object, a marked or novel interpretation is usually inferred. This is generally

reserved for special effect.

In Damana, virtually any noun can be used with more than one spatial relation

verb. The verbal stem is chosen simply to indicate the spatial orientation and not for any

special effect. In the examples above, the changing of verb stem did not shift the focus

from one salient characteristic of the object to another, nor did different verb stems make

the referent of the noun more precise (as in the Navajo money examples). These

examples illustrate rather vividly that Damana does not have a highly grammaticalized

noun class system with clear-cut shape classifications, but rather a scheme which depends

---

[1]The placement of a container using **pa** '(be) flat' is extended from the spatial relation of projecting a boundary (see Figure 3).

on other semantic factors. In each of the preceding examples, it was the spatial relation which proved to be the deciding factor in verb selection and not the shape of the object. Proponents of a 'classical' noun class analysis would argue that in these cases the domain of classification of concrete objects is not extended, but rather only reorganized temporarily (Rushforth 1991), but I would contend that it makes more sense to argue for a verbal system that encodes spatial relations as part of the semantic meaning of the verb rather than a 'rigid' noun class system which can be temporarily reorganized.

In the following example, wood is normally thought of as a stick-like object and so might be expected to appear with **gag** (which following Frank 1990 would be glossed 'long'). However, if used with **te** '(be) upright', a culturally relevant situation is pictured where wood can assume a vertical position. In Wiwa culture, this would typically mean that the wood was placed in a hole in the ground.

(17)   gwiandzhinaga   uraga gawa   awashkuru   kun
        guia   -dzhina -ga   uraga gau   -a u -ashka -ru   kun
        brother-PL   -Erg   house make -Pfv do -when -Top wood

        ate   kun   ate   uka   ni
        a- te   kun   a- te   u -ka   na -in
        in- upright/Pfv wood   in-upright/Pfv do -Prtc be -CK

        'When the older brothers build a house, they put poles in the ground (all around the base of the house).'

Example (18) is an illustration of **te** with another object which is incapable of supporting itself vertically. Culturally, the only way that a pencil (stick-like object) can be vertical and not in something is if it is leaning against another object. The prefix **ku-** 'at' would exclude someone holding it vertically.

(18)   lapiz azhimetamba   kuté
        lapiz azhimeta -ba ku- te
        pencil glass   -Obl at- upright

        'The pencil is standing up (leaning) against the glass.'

The placement of a woven bag would prototypically use the verb **du** '(be) without orientation'. In the following example, however, the use of **gag** '(be) horizontal' indicates that the object is long (horizontal) with respect to some surface. Therefore, the interpretation of the clause below would be that the strap (that part of the fabric-like object which is long) is horizontal (stretched across the body).

(19) busimba naywá   awashkuru   unanzhe dwadu kungaga
      bus -ba nai -unuá u -ashka -ru   una -zhe duadu ku- gag -a
      bus -Obl go -Imn do -when -Top   3s -Poss bag   at- horiz-Pfv

      nigangwa inzhagay   ukwame.
      nigangua i-   zhanga -i   ukuame
      nobody   upon- steal -Ger   prevent

      'As he started to go by bus, he put his bag over his head and shoulders so
      that nobody would steal from him.'

If a woven bag (fabric-like object) is used with **pa** '(be) flat', it signifies that the bag is empty, 'flat against self'. The use of **nun-** 'SO' (Shared Orientation) indicates that the surfaces have the same orientation.

(20) una duadu numpa   nayunuka.
      una duadu nun- pa nai -un -nuk -ka
      3s bag   SO- flat go -Impf-be -Prtc

      'He is carrying an empty bag.'

This is because **pa** 'flat' profiles the interaction of two reasonably flat surfaces. Even though the surface where the object is placed is prototypically flat, this is not a requirement. In the following example, the placement of **munkusara** 'clothes', which would normally be classified as 'fabric-like' and use the verb **du** 'WO', uses **pa** 'flat' which indicates that the clothes are stretched out flat. The exact object that the clothes are placed on is not mentioned, but it is assumed (based on normal cultural patterns) that clothes are flat after they have been washed and are stretched out on large rocks to dry.

(21)   ukunarga   mukusara pa ushi
         u   -kuna   -ru   -ka mukusara pa u -shi
         here-place.of -Top -at clothes   flat do -Caus

         'Put the clothes out (on big rocks) in front of the house.'

In fact, the surfaces may be horizontal, or not even a 'surface' in the normal sense at all.

(22)   suzhi sha igu pa kunuka
         suzhi sha igu pa ku   -nuk -ka
         bird hair here flat Ben- be   -Prtc

         'That bird had long flowing hair down to here (pointing) (lying flat
         against his back).'

A hose is long and would normally co-occur with the spatial relation verb **gag,**

'horiz' for stick-like objects. However, if it is in a disarrayed condition, **du** 'WO' is the

verb chosen to indicate the spatial orientation.

(23)   mangera manzhe shamunkumba dwa
         mangera ma -zhe shamunku-ba du
         hose   2s -Poss head   -Obl WO

         'Your hose is lying (tangled up) on top of the table.'

These examples consistently illustrate that a variety of semantic factors play a

major role in the choice of verb for a particular object. Although objects have

prototypical shapes and orientations, they are freely used with different verbs to express

non-canonical spatial relationships. Carter (for Chippewyan), Frank (for Ika), and Dixon

(for Athapaskan) all make claims regarding the existence of a noun class system. Ika

behaves like Damana in that the so called noun classes are not rigid, and may be

reorganized (if only temporarily) based on semantic factors. I submit that the choice of

verb stem in Damana (and probably also in Ika) is based on spatial orientation and while

certain shaped objects have a proto-typical orientation which normally co-occurs with a

certain verb stem, the choice of a verb not matching up with this orientation does not

give a novel or strange interpretation, but serves only to explain the spatial relation of the object.

CHAPTER 4
SPATIAL RELATIONS AND METAPHORICAL EXTENSION

In this chapter some background is given before looking at the examples from Damana in Chapters 5 and 6. Section 4.1 discusses the grounding of spatial relations; how the categorization of space is based on interaction with the environment. Section 4.2 looks at how these spatial relations, forming part of the human conceptual system, are extended by metaphor to express other concepts.

4.1 The conceptual basis of spatial relationships

There is something almost comforting about categorization. By having things divided up and labeled we feel that we understand them. A salient example of categorization is the geographical and political divisions of the world. To know how a city is laid out or what countries are in a continent makes one feel that the territory is understood. The space in which we live and interact is categorized for the same reason.

Urban (1939:186) states that 'our intellect is primarily fitted to deal with space and moves most easily in this medium. Thus language itself becomes spatialized, and in so far as reality is represented by language, reality tends to be spatialized.' Spatial relations are encoded in languages in terms of propositional representations.

The propositional representation consists of a predicate and two arguments. The first argument, the referent, specifies the features or objects being located; the second, the relatum, specifies the frame of reference in which that location is defined. The predicate is a categorical spatial concept that describes the relation between the object (referent) and the frame of reference (relatum) (Bialystok and Olson 1987:511).

22

The concept of space that is important in this paper is not the Newtonian concept of space (that is, space which is completely continuous and homogeneous, going on without seam in three open-ended dimensions), but rather relativistic space. Newtonian, or absolute, space is a coordinate system independent of any of the things that the space might contain, while relativistic space references the spatial relations relative to the objects that occupy it. In relativistic space, a landmark is selected and coordinate axes are oriented from this landmark. These are the relational structures that preserve properties like shape, size, orientation, direction and dimensionality.

As human beings, we impose spatial structure on virtually every scene by categorization. In describing a scene, a referent is selected and contrasted against some relatum. The primary relatum is oneself—one's own body. Cassier (1923) and many others have maintained that primitive spatial relations deal with the body and what is 'at', 'in', or 'on' our own bodies. As a child begins to categorize his spatial surroundings, up/down, front/back, and right/left (the primary categories for interpreting objects in space, Bialystok and Olson 1987:513) are all learned with respect to the child's own body.

As the child progresses, the need arises to reference locations away from the body. His egocentric conceptualization of space is not eliminated, but a competing, supplementary system is created in which a separate object becomes the relatum. Therefore, for adults, there are two ways of anchoring an object in space: using the body as the relatum or another object.

Once a person has learned to use an object as relatum in his view of space, the problem arises of assigning meaning to the primary categories of up/down, front/back, and right/left. The assignment of up/down is fairly straightforward, but front/back is more difficult to ascertain. Teller (1969) states that 'front' is defined in terms of something that is functionally prominent. Fillmore (1971) (as cited in Miller and

Johnson-Laird 1976:400) claims that with animate objects, the front is considered to be the side that contains the main organs of perception. Miller and Johnson-Laird (1976) contend that the front should be the side in the direction of normal motion but point out that the location of the organs of perception outweighs consideration of direction of motion because a crab is said to walk 'sideways'; its primary motion is not in the direction of its head, yet "side" and "sideways" are assigned with respect to the head.

In the absence of overriding circumstances, the front of an inanimate object is usually the side closest to the person assigning the categories of front/back. Overriding circumstances include the aforementioned direction of motion and situations in which, based on pervasive metaphors, an object has a culturally assigned front or back. Among the Wiwa, for example, houses have only one door. Based on the metaphor 'the body is a container', the opening for the door would correspond to its organ of perception or ingestion, and therefore, the side of the house where the door is located is considered to be the front. In this way, whenever possible, each object, whether animate or inanimate, is assigned a front, back, top and bottom from which to make reference.

4.2 Metaphor

Metaphor is the process of transferring or projecting some concept from a known (source) domain to structure a concept in perhaps an abstract or less known (target) domain. 'Much of our social reality is understood in metaphorical terms, and since our conception of the physical world is partly metaphorical, metaphor plays a very significant role in determining what is real for us' (Lakoff and Johnson p. 146). Taking what has been learned on the basis of experience and applying it to new ideas is a way of categorizing and making sense of phenomena in the world in terms that are familiar. In this way, metaphor is present in all areas of life, thought, and action. There may be some debate as to the extent that the way we perceive the world is affected by the way we talk

about it , but there is little doubt that our perception of the world affects our communication about it (Miller and Johnson-Laird 1976).

Many fundamental concepts of a culture are organized in terms of spatialization metaphors. Lakoff and Johnson (1980) claim that most metaphorical expressions in a language have to do with the projection of spatial orientations. Spatial schematic concepts, therefore, form the foundation of our conceptual system. They emerge through our interaction with the physical environment and are the concepts we live by in the most fundamental way. These spatial concepts recur in our everyday bodily experience and include containers, paths, links, and various orientations and relations: up-down, front-back, part-whole, center-periphery, etc.

The verbs introduced in Chapter 1, as well as the verbs presented in Chapter 6, are all spatial relation verbs. These spatial relation verbs are extended by the following orientational metaphors which have been taken from Lakoff and Johnson (1980): (1) 'Conscious is up; unconscious is down.' This is experientially based on the fact that humans lie down when asleep and stand up when awake. (2) 'Health and life are up: sickness and death are down'. This is reinforced by the position of sick and dead people. In Damana, 'to live' and 'to bury' will be shown in Chapter 5 to be based on this metaphor. (3) 'Having control or force is up; being subject to control or force is down.' In Chapter 5, this is illustrated in Damana with the spatial relationship 'to be over' as 'to be in control'. A related but distinct metaphor in Damana equates 'to be in front' with 'to be up' when talking about being in control. (4) 'More is up; less is down.' This is based on the image of adding a substance to a container or objects to a pile. As more is added, the level goes up. In Damana (Chapter 5), this metaphor is used with 'to be full'. (5) 'High status is up; low status is down.' Another Damana-specific metaphor equating 'to be in front' with 'to be up' is 'high status is to be in front; low status is to be behind.'

'To be in front' in Damana means 'to be responsible' or 'to be in charge'; this is illustrated in Chapter 6.

Besides orientational metaphors, spatial relation verbs are also extended using metaphors[1] that arise out of experiences with physical objects (especially one's body). These metaphors treat events and activities as entities and substances. In Damana, container metaphors are used to extend concepts such as 'to be cloudy', 'to cooperate' or 'to be attentive'. Locations are also treated as objects (container-like) after artificial boundaries are imposed (e.g. a clearing in a forest). The term 'steep slope' (see example 93) in Damana is a personification of a person going down a steep slope. An activity to be halted in Damana is viewed as an object that can be 'wrapped' and left behind.

Another means of extension that I treat as a subset of metaphor is metonymy—when one entity is referred to by some associated entity. The designation of a part to represent the whole is a common example of this in many languages (e.g. heads of state). The experiential basis of metonymy is more obvious because it usually involves direct physical or causal association (Lakoff and Johnson 1980). Damana, having mostly stative verbs, uses resultant state in many cases to represent the process (end for means), and vice versa (means for end). End for means is illustrated in Damana with 'to have a gap between' meaning 'to fly' and 'to cause a gap' being used to represent the activity of fanning (a fire). Means for end can be seen in the term for 'sweet' which is literally 'to have caused to go around in a circle' (see example 168) and 'to receive' which is ' to cover with hands'.

In summary, categorization based on spatial concepts is a natural consequence of interaction with a physical environment. From this interaction, two systems of deictic reference emerge; one using the body as the relatum and the other using an object. The

---

[1]Lakoff and Johnson (1980) label these as ontological metaphors.

metaphorical extension of these spatial concepts is accomplished using orientational metaphors, metaphors treating events and activities as objects, and metonymy. These various strategies of extension are illustrated in the next two chapters, showing that the 'core' concepts being extended with the verbs have to do with spatial relations, not shape.

CHAPTER 5
METAPHORICAL EXTENSIONS OF SPATIAL RELATION VERBS

In this chapter I present the primary evidence that what is extended by metaphor with the spatial relation verbs introduced in Chapter 1 is not shape, but spatial orientation. This illustrates the claim that extrinsic factors are what is important to these verbs, not inherent properties of the object like shape and material. This, in turn, argues against a noun class analysis of these verbs. The discussion concurs with Mithun's (1989) claim that languages with extensive verbal morphology categorize aspects of events and states rather than inherent properties of objects.

5.1   Te '(be) upright'

As might be expected, te '(be) upright' occurs frequently in metaphors whose source domain is verticality. Up-down is one of the basic or primitive orientations (Lakoff and Johnson 1980) and when extended to structure some other concept or abstract domain, the shape-class of 'solid object with discernable base' is really not an issue. 'To be standing' is structured from the core sense of te '(be) upright'. Zhite (zhi- 'OblR' + te 'upright') literally means 'to be upright on one's own (feet)'.

> (24) manzhingwia   zhite   kayaru   nekuzhi   terga
>   ma- zhi- guia   zhite   kaia -ru nai -kuzhi te -ru -ka
>   2s- Poss- brother stand.up after -Top go -Hor   field -Top -at
>
> 'After your older brother stands up, let's go to the field.'

When te 'upright' is used in situations not involving placement or location, there is a strong sense of inactivity or stillness. For example, the term in Damana for a

cultivated field is te[1], referencing the verticality of the plants and the stillness or rooted aspect that is extended in this use. Often the vertical component is ignored or suppressed, and the stillness aspect is extended. Compounded with the morpheme zi 'careful', te means 'be very still'. As with many compounds that use zi-, there is a certain element of secrecy and the implication of being hidden.

(25) uragurga   zite   kuma nukuga   nurtshwi   ukwame.
     uraga -ru -ka zite   kuma nuk -kuga nu-   dzhi- tu -i   ukwame
     house-Top -at be.still InfW be   -1sFP 1sDO- 3pS- see -Ger prevent

'In the house I was quiet and still to prevent them from seeing me.'

'To bite' is also derived from the verb te 'upright'. The compound (kuka 'tooth' + a- 'in' + te 'upright') literally means 'to put teeth in vertically'. The shape of teeth is not the prototypical one for te, but this is irrelevant, the important element of meaning is verticality.

(26) ukwemundzhi   umamba kukate
     u -kua -i   -mundzhi uma -ba kukate
     do -FP -Ger -from   eye -Obl bite/Pfv

'Afterwards (they) bit the eye.'

With string, te is extended to mean 'to be tied up'. Cultural information comes to bear here, in that a trap is strung with enough tension so that when an animal comes, the string releases, thereby trapping the animal. When the trap is set, the string has a vertical orientation. In the following example, shate (shi 'string' + a- '3sIO' + te 'upright') means 'to be tied up'; a- '3sIO' cross-references with dumaga 'puma'.

---

[1]Interestingly, Adams and Conklin (1973) claim that the basic shapes (orientations) which are the strongest metaphors occuring in classifier systems all have their source or basis from plants.

(27)   shigi   dumaga   shateshunga
      shigi   dumaga   shate   -shi -unga
      tomorrow puma   be.tied.up -Caus-1sFut

'Tomorrow I will trap the puma.' (Literally: 'Tomorrow I will cause the puma to be tied up.')

'Having hair piled upon the head' is expressed by compounding te 'upright' with zhi-[2] '3pS' and i- 'upon' to indicate that hair is upright on another upright object. All Wiwa have very long hair, and when it is hot, a man will pile his hair up on top of his head and hold it in place with a hat in order to keep it off of his neck. Interestingly the expression has been extended and conventionalized to mean 'short hair'. -kwega (-kua 'exist' + -ai 'Advzr' + -ka 'Prtc') is suffixed to ishte (i- 'upon' + zhi- '3pS' + te 'upright') to make the predicate adjective 'existing piled upon'.

(28)   unguzi   sha   ishtekwega
      unguzi   sha   ishtekwega
      little.bit hair short

'He has somewhat short hair.'

Here again, the verticality of te is what is important, not the shape of the object involved since hair is prototypically associated with pa '(be) flat'.

'To be tall' is derived from te emphasizing verticality. The predicate adjective zhitekwega (zhi- 'OblR' + te 'upright' + -kwega), which literally means 'to exist standing up on one's own (feet)', has been conventionalized to mean 'to be tall'.

---

[2]Dzhi- '3pS' in certain environments has a variant form zhi-. Its use with orientation verbs indicates that the objects in the spatial relationship being discussed are in the same orientation.

(29) ranzhingwiaru   zhitekwega nunamekuma   mandakangwa
     ra- zhi- guia -ru   zhitekwega nun -ame   -kuma manda -ka -gua
     1s- Poss- brother-Top tall   be -because-InfW above -at -also

     mangu gugá   awá
     mangu gug -á   u -á
     mango get -Pfv   do -Pfv

     'Because my older brother is tall, he can get even the high mangoes.'

'More is up; less is down' is a metaphor that utilizes verticality as its source domain. This metaphor is based on perceptual experience because as more of a substance or more physical objects are added to a pile or a container, the visible level of the substance goes up. 'To be full' is structured from this metaphor. Example (30) refers to the situation where there is a sufficient quantity inside a container to be considered 'heaped' out the top. **Atesha** (**a-** 'in' + **te** 'upright' + **-shi** 'Caus' + **-a** 'Pfv') literally means 'to cause to be upright inside' and is conventionalized to mean 'full'. Again, shape is irrelevant.

(30)   ingwi atesha unakunga
      ingwi atesha u-   nak -unga
      one   full   Por-come -1sFut

      'I will bring one potful.' (Literally: 'I will bring one full pot.')

In the following group of examples, the idea of verticality is extended to mean 'to be alive'. These are examples of the metaphors 'health and life are up; sickness and death are down' (Lakoff and Johnson 1980). In Damana, **unte** (**un-** 'IndefLoc' + **te** 'upright') is used to mean 'to be alive' or 'to live'.

(31)   nawindzhinaru   zumé unte nukuzhín.
      nawi -dzhina -ru   zume unte nuk-kut -u   -in
      1p   -PL   -Top well   live   be -1pS -Wit -CK

      'We all are living well.'

(32)   shiká   peburumba   dzhuntenuka
          shiká   peburu -ba   dzhi- unte-nuk -ka
          people   village -Obl 3pS- live -be   -Prtc

          'People are living in the village.'

The following word for 'bus terminal' was coined in the past few years and

illustrates the continuing productivity of the combinatory process using these spatial

relations. The literal meaning of **karundzhina untekumeku** is 'place where cars exist

spread out'. This implies that inanimate objects 'live' there in the same way as the

people live in their home village. The ideas of stillness or inactivity (parked) and 'to

live' both seem involved in this extension.

(33)   karundzhina   untekumeku
          karu -dzhina   unte -kub   -eku
          car   -PL   live -UnsAg -LN

          'bus terminal'

When the location of existence is a known site, **gu-**[3] 'definite location' (DefLoc)

is prefixed to **te** 'upright'. The resultant word, **kuté** (**gu-** 'DefLoc' + **te** 'upright'), also

has the connotation 'to be alive' or 'to live'.

(34)   manzhe   kunsi kutengwi   nukú?
          ma -zhe   kunsi gute -gui   nuk -ú
          2s -Poss dog   live   -still be -Q

          'Is your dog still alive?'

In the following example, the extension is complete in that **kuté** means 'to be

alive' with no indication of a particular orientation. It still could be referring to the

metaphor of 'health and life are up; sickness and death are down' in the aspect of being

'alive' (smoldering), but no element of verticality is evident here. There is problably a

related metaphor such as 'living is energy emitting (working)' that applies here.

---

[3]/g/ devoices when the stem begins with a voiceless consonant.

(35)   gie unguzi kutengwi
gie unguzi gute -gui
fire a.little live -still

'The fire still has some live (coals).' (still smoldering)

Kuté 'to live' has been conventionalized to mean 'to be seated' because one sits where one lives. A common response to one of the greetings in Damana is either 'I'm standing' or 'I'm sitting'. When **kuté** is used, the person is in a seated position. The emphasis is not on verticality but on the emotional state of 'to exist peacefully at home', extending the inactivity aspect of **te**.

(36)   teruaru   zhonunka   kuté.
terua -ru zha -un -nun -ka kute
man -Top eat -Neg -be -Prtc live

'The man had not eaten, (therefore) was seated.'

A common practice in language is to extend the body's orientation to inanimate objects. Therefore, in Damana, a mountain has a foot, a side, and a head. **katena** (**ku-** 'at' + **a-** 'in' + **te** 'upright' + **-na** 'be') in Damana means 'side' of a mountain, while **tena** (**te** 'upright' + **-na** 'be') means 'side' of a body. I would suggest that the word for 'side' is derived from **te** '(be) upright'.

(37)   mamarongo arukaru   katena aruka   ni.
mamarongo arug -ka -ru katena arug -ka na -in
Mamarongo ascend -Prtc -Top side   ascend -Prtc be -CK

'To go to Mamaronga, one has to go up a side (of the mountain).'

The Wiwa people, living scattered over a mountain range, view life as a journey progressing up a mountain (Hensarling: in preparation). When readers are told to go to the beginning the page, they immediately go to the bottom. When the older leaders are ready to die, they make their final trek up to the top of the mountain to be with the spirits of their ancestors in the snow caps. This mountain analogy of bottom to top can be

viewed as describing the various stages of an activity. All activities have a beginning (at the foot), a middle (at the side) and an end. The middle of a journey would be on the vertical side of the mountain. I would suggest that -ʉnte 'continuative' (Cont) aspect, which is comprised of -ʉn 'imperfective aspect' (Impf) and -te, is derived from te 'upright'.

(38)   asi   ʉnanzhc   ʉragʉrgɔ   nayanʉnka   nʉnka
        asi   ʉna -zhe   ʉraga -ru -ka nai -á -nʉn -ka nʉn -ka

        mushinawa nak -ʉnte nuk -ʉ   -in
        again   come -Cont be -Wit -CK

'The older sister had left her house and was once again coming.'

In summary, Table 2 shows how the verticality aspect of te has been extended in metaphor in the previous examples. If this verb were a noun class indicator, one would expect the extensions would involve some specific shape of object. What has been extended with various metaphors is not shape, however, but the idea of verticality, a spatial relation.

Following the discussion of each spatial relation verb, a table (like Table 2) is given. Each of these tables consists of three columns. In the first, labeled 'expression', are the uninflected stems in bold print. Below each are highly literal glosses, which are in some cases more etymological than a representation of any actually occurring sense. The actual senses, represented with idiomatic glosses, and including any extended or figurative meanings, are given in the column labeled 'senses'. The third column gives the basis for the extensions.

Table 2 Spatial Relation: te 'be upright' (Verticality)

Expression	Sense	Basis for extension
zhite to be upright on own (feet)	to be standing	general characteristic (verticality) for specific situation (standing)
zite to be careful and upright	to be very still	inactivity of plants
kukate to put teeth in vertically	to bite	verticality of teeth
shate to be with string upright on him	to be tied up	general characteristic (verticality of string) for specific situation (tied up)
ishtekwega one upright object existing upon other upright object	be short (e.g. hair)	generalization of hair being piled vertically on head to mean short (hair)
zhitekwega existing upright on own (feet)	be tall	general characteristic (verticality) for specific situation (tall)
ateshi to cause to be upright inside	to cause to be full	more is up; less is down
unte to be upright at indefinite location	to live	Health and life are up/ vertical; sickness and death are down/horizontal
kuté to be upright at definite location	to live	Health and life are up/ vertical; sickness and death are down/horizontal
	to smolder (e.g. fire) to be seated	living is energy emitting inactivity of plants

-unte	continuative aspect	activities are like journeys up
to be doing something upright		a mountain; 'upright' is mid-slope

The following figure illustrates the relationships among the various senses of **te** 'upright'. The dotted lines indicate a derivational process which may also include extensions of meaning while the other lines involve only extensions of meaning. Core meanings of the word are in the heavier larger circles. A figure similar to this is provided for each verb discussed. This is patterned somewhat after Taylor's (1989) and Lakoff's (1987) concept of categorization by prototype, except that a schematic representation of the conceptual core of the category is used instead of a central member.
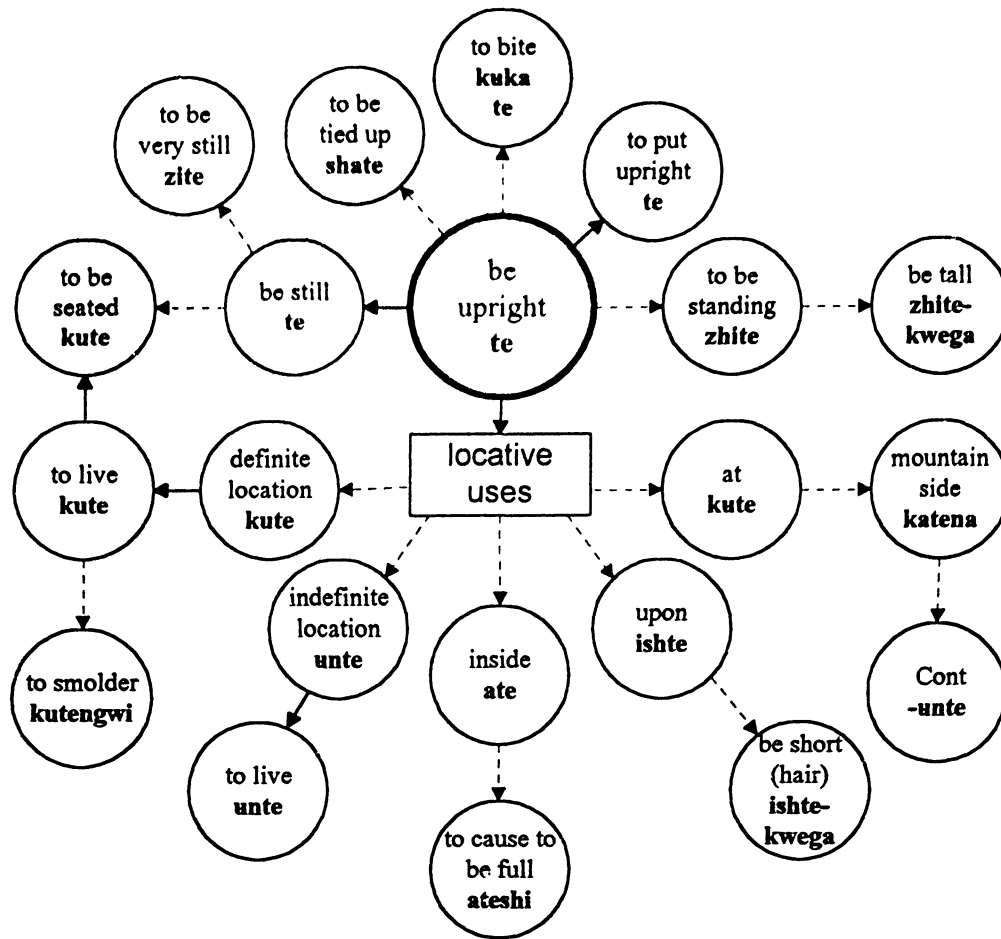

Figure 1   **te '(be) upright'**

5.2   Gag '(be) horizontal'

Under a noun classification system, **gag** '(ʰɛ) horizontal' (horiz) would be associated with one-dimensional, 'stick-like' objects. In metaphorical extensions,

however, it is not the stick shape which is extended, but rather the concept of 'horizontal'.

Gag 'horiz' is the complement of te 'upright' in several ways. While te 'upright' is used for 'to be standing up', gag is used for 'to be lying down'. This is structured from the core sense 'to be horizontal' and is a basis for the metaphor 'conscious is up; unconscious is down'.

(39) nukweru   utunaru   gagá
      nuk -kua -i   -ru   utuna -ru gag -á
      be -FP -Ger -Top   old   -Top   horiz -Pfv

'And so the old (woman) was lying down (to go to sleep).'

Utilizing the metaphor 'health and life are up; sickness and death are down', gag 'horiz' is used as a component of the concepts 'unconscious', 'dead' or 'buried'.

(40) gwia   kunkushina zhinguma   wida   ukweru   ungina
      guia   kunkushina zhi- guma   uid -a   u -kua -i   -ru   ungina
      brother Kunkushina Poss- son   die -Pfv do -FP -Ger -Top stone

      mungunamba   iringagá   kunguma sikarga
      munguna -ba   i-   dzhi- gag -a   kunguma sika   -ru -ka
      above   -Obl upon-3pS- horiz -Pfv earth   below -Top -at

'The son of the older brother Kunkushina died, and they laid him
stretched out over a rock (buried him) below the ground (in a cave).'

The concept 'to resuscitate' or 'to bring back to life' is built on gag 'horiz'. The verb nungaga (gag 'horiz' + nun- 'SO' (Shared Orientation)) used with 'spirit', uruama, literally means 'to put spirit horizontally with same orientation (as body)'. The use of nun- indicates that both the referent and the relatum have the same orientation. This has cultural significance because in order to revive someone, the mama (religious leader) levitates himself in a horizontal position above the unconscious person. The purpose of this, as I understand it, is for the mama to become one with the patient's spirit. This is extended using means for end.

(41) Moyawi ϑϑϑiraga   ga   awanunka   nunkwa mushinawa
     Moyaui dzhira -ga   ga   u -a -nun -ka   nun -kua mushinaua
     Moyaui water -Erg   eat/Pfv do -Pfv-be   -Prtc be -FP again

uruama nungagá
uruama nun- gag -á
spirit SO- horiz -Pfv

'Moyawi had drowned, but (he) brought him back to life again.'
(Literally: 'The water had eaten Moyawi, but he (the mama) put his spirit horizontal (same orientation, like that of the patient, and the patient again lived').

The concept 'to be tight' is derived from **gag**. The verb in example (42) is based on the spatial relation formed when a 'drawstring' is tight around the waist forming a horizontal/level plane. **Gag** is negativized and means 'not tight' (not horizontal).

(42) pertshina   munkusara ingagún.
     pertshina   munkusara i-   gag -ún
     drawstring   clothes   upon-horiz -Neg

'The drawstring on his clothes is not pulled tight.'

(43) gwiandzhinaga   shimbun gu[4] angazhi   munkusara
     guia -dzhina -ga   shimbun gu   a- gag -i   munkusara
     brother-PL -Erg   rope   effort in-horiz -Ger clothes

imbishunkamba
i-   bi   -shi -unka -ba
upon- hung -Caus -Fut -Obl

'The older brothers stretched tight the rope over which the clothes would be hung.'

In a further extension, 'tightness' is important and **gag** is not required to adhere to any spatial features such as horizontal or level, let alone shape or rigidity. In the fllowing examples, **gag** simply means 'tight', regardless of orientation, shape or material of object being pulled.

---

[4]**gu** is an onomatopoeic word associated with activities that require effort.

(44)   bu   gu   angazhi   awanugin.

bu	gu	a- gag -i	u -a -nuk -u -in
hammock	effort	in-horiz -Ger	do -Pfv -be -Wit -CK

'He strung the hammock tight.'

The following example reflects the Wiwa's concept of having goosebumps, considered to be small pieces of fear which are stretched over the body. The concept is structured by an extension of gag 'horiz' to mean 'tight'. The sensation of tightness of the skin is what is being categorized here. Note that this is now applied to a two-dimensional surface—the original one-dimensional shape is completely lost.

(45)   zeburu   angaga   namusín   dumaga   tukwashka.

ze -buru	a- gag	na -mut -in	dumaga	tu -kua -ashka
fear -Dim	in-horiz	1sIO-enter -CK	puma	see -FP -when

'I had goosebumps, I was frightened when I saw the puma.'

In metaphorical extensions with **gag**, the concept of 'horizontal' is extended in other ways. 'Balance' is another primitive schema like 'up-down' (Lakoff and Johnson 1980). Horizontal is closely related to 'balance' in Wiwa culture. Bridges are made by balancing logs across streams with the ideal being that the log forms a nice horizontal plane. Hoppe (1982) states that 'balance' is one of the most important concepts (in a figurative sense) in the Wiwa's world view. Example (46) is extracted from a story relating how mankind is responsible for maintaining the balanced condition of the world. The Wiwa believe that the egg-shaped world is balanced on two poles by their ancestors, and by their correct living and sacrifices, this balance is maintained. Gag is used, even though the world is not 'stick-like'.

(46)   zʉdúa zhingagúni
zʉdúa zhi-   gaga -úni
well   OblR- horiz -NegPfv

'(From then on mother earth) was not level or balanced (and therefore we experience earthquakes).'

(47)   ungina mungunaka   kʉn   ingaga   ushi.
ungina mungʉna -ka kʉn   i-   gag u -shi
rock   above   -at wood upon-horiz do -Caus

'Balance the log on top of that rock.'

The concept of balance is extended to mean 'to trust'. 'To balance your spirit on someone else' is to put your spirit in their control, thereby trusting them. Here, clearly, it is the spatial relationship, not the shape, which is the basis of the extension.

(48)   ruama sigandzhinaga   anzhabumba   ʉruama
ruama siga   -dzhina -ga a- zhi- abu   -ba ʉruama
spirit progeny -PL   -Erg 3s- Poss- mother -Obl spirit

ingaga   uka   ni
i-   gag -a u -ka na -in
upon- horiz -Pfv do -Prtc be -CK

'Children always trust their mother.' (Literally: 'Offspring always put their spirit over their mother.')

Table 3 summarizes the 'horizontal' aspect of gag as it has been extended in metaphor. In the use of metaphor, it is the spatial relation 'horizontal' that has been extended and conventionalized in the formation of abstract concepts.

Table 3 Spatial Relation: gag '(be) horizontal'

Expression	Sense	Basis for extension
gag to be horizontal	to be lying down	general characteristic (horizontal) for specific situation (lying)
ingag to put horizontally upon	to bury (in cave)	health and life are up/ vertical; sickness and death are down/horizontal
	to balance	level/balanced is horizontal
	to trust	to trust is to balance one's spirit on another person
nungag to put object (spirit) horizontally over another horizontal object	to resuscitate	means (placing body/spirit horizontal) for end (resuscitate)
ingagún to be not horizontal upon something	to be slack, loose	tight is horizontal
angag to put inside horizontally	to stretch/pull tight	tight is horizontal
to be inside horizontally	goosebumps	feeling of tightness in skin when having goosebumps
zhingaguni to be not horizontal on own	to be not balanced	level/balanced is horizontal
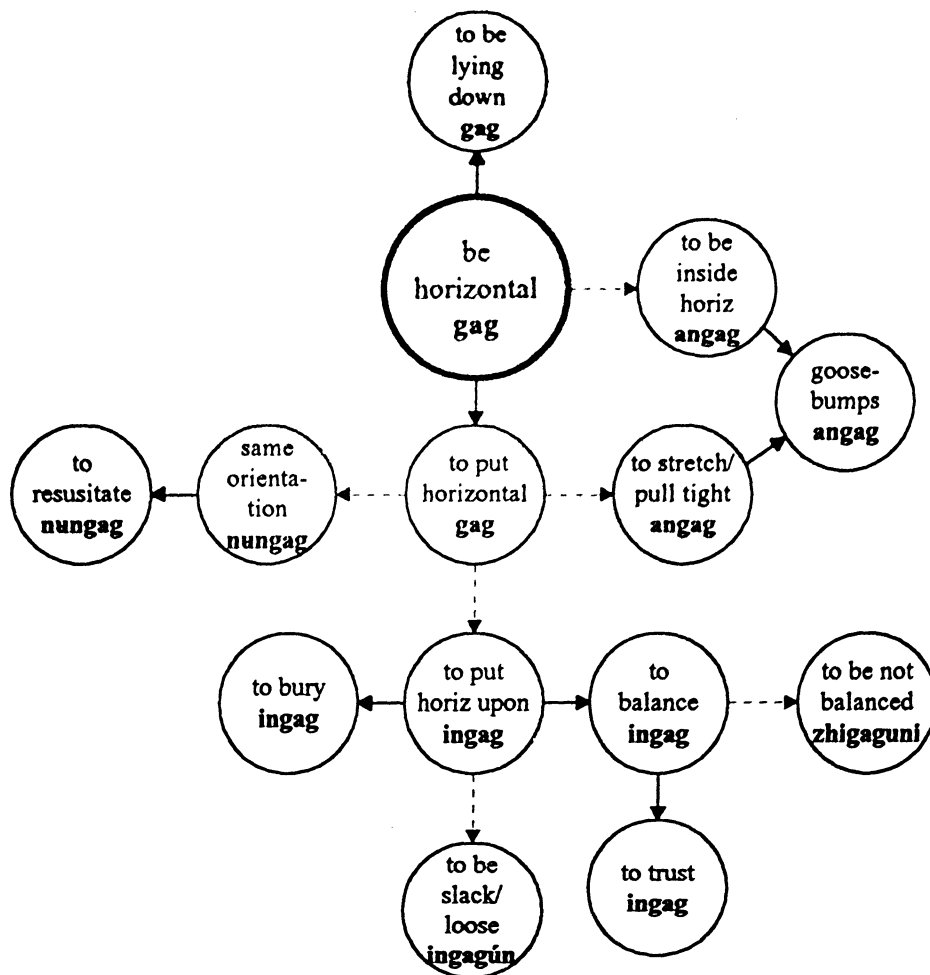

Figure 2   **gag '(be) horizontal'**

5.3 Pa '(be) flat'

Pa '(be) flat' is often associated with two dimensional 'tortilla-like' objects. Prototyically it denotes the spatial relation of one plane over another. In extensions, it is also used when covering a container. The opening of the container is viewed as a plane. The relationship in focus here is not the shape of the object being used to cover the

container, but rather the formation of a boundary over the container. The projection of a

boundary is one of the basic spatial schemas (Lakoff and Johnson 1980).

(49) Sindigaru buku guma apa awanunka
Sindi -ga -ru buku gum، a- pa -á u -a -nun -ka
Cindy -Erg -Top pot opening in-flat-Pfv do -Pfv-be -Prtc

ni goruma musi ukwame
na -in goruma mut -i ukwame
be -CK fly enter -Ger prevent

'Cindy had covered the pot to prevent flies from entering it.'

This sense is extended to mean 'to take hold of', as a type of covering using the

hands. This sense uses the form pan (pa 'flat' + -n 'Actvzr').

(50) ra zhinzhoma gaunwa awangashka lapi kogunamba
ra zhinzhoma gau -unwa u -unga -ashka lapi koguna -ba
1s book make -Imn do -1sFut -when pencil hand -Obl

apana awangemundzhi zhinzhoma gauga ni.
a- pan -a u -unga -i -mundzhi zhinzhoma gau -uga na-in
in-hold -Pfv do -1sFut -Ger -from book make -1sPrtc be-CK

'When I start to write letters, I take hold of a pencil with my hand and
afterwards I write.'

In example (51), the prototypical sense of 'to cover' is not present; only the part

that is taken hold of is covered by the hand. With indirect object agreement,[5] apan

means 'to take hold of something that is part of someone else'. This is normally used to

indicate taking hold of an arm or neck where the fingers can encircle, and is an example

of the part representing the whole.

---

[5]Indirect object marking is used at times in Damana to indicate possession. These could probably be
viewed as 'ethical datives' (Tuggy 1980).

(51) anzhinguma   balonkwarga   mundzhi
a- zhi- guma balonkua -ru -ka mundzhi
3s- Poss- son   balcony -Top -at from

ashengwemundzhiru   anzhabu   apana.
a-   shen -kua -i -mundzhi -ru a- zhi- abu   a-   pan -a
3sIO-fall -FP -Ger -from   -Top 3s- Poss- mother 3sIO-hold -Pfv

'Her son, after jumping from the loft, took hold of his mother.'

The sense 'to take hold of' is extended further to mean 'to receive'. In this

extension, the manner of obtaining the item in question is being used to represent the end

result of receiving the object. In example (49), **ipan** (**i-** 'upon' + **pa** 'flat' + **-n** 'Actvzr')

means 'to receive', or more literally, 'to take hold of (cover with hands)'.

(52) nugwia   raga   Lorenzonzhe ipana   ukugín.
nu-   gui -a   ra -ga Lorenzo -zhe ipan -a u -kug -in
1sDO- tell -Pfv 1s -Erg Lorenzo -Poss receive-Pfv do -1sFP -CK

'He told me that he had received (a letter) from Larry.' (Literally: 'Told
me, "I had hold of one of Larry's."')

Besides receiving concrete objects, **ipan** can also be used to receive information.

Information is treated as a concrete object, but there is no sense of covering with the

hands.

(53) ragaru   gegurga   inzhina
ra -ga -ru   gega   -ru -ka inzhina
1s -Erg -Top Sierra.Nevada -Top -at how

zhanekunuka   dura   ipana
zha- nek -un -nuk -ka dura   ipan -a
UnsO- make -Impf-be -Prtc message receive-Pfv

awanarga   ni
u -a -nan -uga   na -in
do -Pfv-be -1sPrtc be -CK

'I have received information about what is happening in the Sierra.'

The object of 'receive' does not have to be flat. In example (54), a concept with no physical shape at all is received. Note that **zhi** '3pS' occurs between **i-** 'upon' and **pan** 'hold' and means that the objects are in the same orientation. In this case, the two objects are understood to be two hands. 'To take hold of' or 'to receive' something with two hands implies a deep commitment.

(54) raru   iwa   3 de febrero   kunkushina ishpana
     ra -ru   iua   3 de febrero   kunkushina i-   zhi- pan -a
     1s -Top today 3 of February   God   upon- 3pS- hold -Pfv

    imamba   Diana nun
    ima -ba   Diana nun
    this -Obl   Diana with.

    'On the third of February, I received God (Christ) with (the help) of this Diana.' (Literally: 'I, on the 3 of February, took hold of God with this Diana.')

Ipan is also used to receive people as in the sense of 'to greet' or 'to accept'. The following example uses a negative form with the sense of 'to not accept.' **Dzhi**[6] '3pS' is placed between **i** 'upon' and **pan** 'hold'.

(55) ra shikandzhina   kena   argwanunkuga
    ra shika -dzhina kena   arug -a -nun -kuga
    1s people -PL   to   ascend -Pfv-be -1sFP

    nusirpanuni   suntaru nunkugame
    nu- i-   dzhi- pan -uni   suntaru nun -kuga -ame
    1sDO- upon- 3pS- hold -NegPfv outsider be   -1sFP -because

    'I had gone up to the people (Wiwa), but they did not accept me because I was an outsider.'

It has been shown that **pa** is extended to indicate 'to be covered'. To cover the opening is to close a container. Example (56) illustrates that to close a glass is to put its open side face down over another surface.

---

[6]**Dzhi-** '3pS' in certain environments has a variant form **r-**.

(56)   mesamba   azhimeta pa
         mesa -ba   azhimeta pa -á
         table -Obl   glass   flat -Pfv

'He put the glass on the table.'   (opening flat on the table)

If a container is closed, the openings through which objects can enter is covered. Using the metaphor 'the body is a container', 'to close the body' is to cover the face since food, images and smells all enter the body through openings in the face.

The head, because of its functional prominence, is used to represent the body. This also is a form of metaphor. In example (57), the whole body is floating in the water, but its spatial orientation is face down. What is being extended is the idea of closing an opening, not the placement of a 'tortilla-like object'.

(57)   dzhiraka   kupá   nushín
         dzhira -ka ku- pa   nuk -in
         water -Loc at- flat be   -CK

'The person is floating face down.' (not seen by speaker)

'To have one's mouth closed' is structured from **pa** 'flat' meaning literally 'to have the container covered'. In this situation, there is definitely no 'flat' object involved in the extension.

(58)   kuká   pa   kuté
         kuká   pa   gu-   te
         mouth flat DefLoc- upright

'He is sitting and won't talk.' (Literally: 'He is seated with a closed mouth.')

The Wiwa view the world as a container with the sky as the opening. As a container, the world can be open and closed. To be cloudy is to have the opening of the world sealed or closed.

(59) moya guma apánunka
moia guma a- pa -á -nun -ka
cloud opening in-flat -Pfv-be -Prtc

'It is cloudy.' (Literally: 'Clouds have closed the opening to the world.')

As mentioned in Section 5.1, activities in Damana are viewed as journeys up a

mountain. The beginning of any activity is seen (metaphorically) as being 'horizontal' at

the base or 'foot' of a mountain. **Pa** 'flat', represents the plain before starting up the

slope of a mountain. I suggest that **pa** '(be) flat' combines with imperfective aspect **-un**

to derive inceptive aspect **-umpan** (**-un** 'Impf' + **pa** 'flat' + **-n** 'Actvzr').

(60) unzhina kunzhazhi   dumegumumpana
unzhina ku- zhan -i duma -ai -kub -unpan -a
how   Ben- be -Ger crazy -Advzr-UnsAg -Incp -Pfv

'This is how play began.'

In summary, **pa** '(be) flat', when extended in metaphor, primarily utilizes the

ideas of 'to be covered' or 'to be closed' rather than expanding on the flatness of objects.

Table 4 summarizes the above examples:

Table 4 Spatial Relation: pa '(be) flat' (Projecting a boundary)

Expression	Sense	Basis for extension
apa to put flat inside	to cover	project a boundary
apan to cover in hand	to take hold of	means (cover with hand) for end (take hold)
ipan to cover with hand on top	to receive (object) to receive (info)	means (cover with hand) for end (receive) information as object
ishpan to cover with hands on top	to receive (Christ)	abstract concept as object
ipanuni to not cover with hands on top	to not accept	means (not to cover with hands) for end (reject)
kupá to be covered in/at	to be covered (face)	body as a container
kuka pa covered mouth	closed mouth	body as a container
apanunka be covered inside	be cloudy	world as a container
-umpan activity occurring where it's flat	inceptive aspect	activities are like journeys up a mountain; 'flat' is 'at the point of beginning an ascent'

Figure 3   pa '(be) flat'

5.4   Du '(be) without orientation'

Du '(be) without orientation' is associated with 'fabric-like' objects in prototypical orientation and has no fixed orientation in spatial terms. This lack of definite orientation is extended metaphorically to mean 'undeveloped' or 'without definite shape'. It can be used to describe a fetus or a very young animal before it has

achieved a readily recognizable form. A reduplicated form **undundu** (**un-** 'IndefLoc' +
du 'WO' + **un-** 'IndefLoc' + **du** 'WO') means 'very young' or 'undeveloped'.

Reduplication in (61) probably serves to stress the overall shapelessness or lack of form.

(61)   somʉndundu
       soma -ʉndundu
       baby -undeveloped

       'fetus'

(62)   misiru   ʉndundungwi   kwagumanʉnka   kʉma ná
       misi-ru   ʉndundu   -gui kuagub-a -nʉn -ka   kʉma na -á
       cat -Top   undeveloped -still born -Pfv-be   -Prtc InfW be -Pfv

       'The kittens were born too soon.'

The sense of formlessness is extended to indicate the condition of being 'reborn' in a
figurative sense. This is a common concept in the culture referring to a complete change
within a person.

(63)   abuga   zhingwiru   ʉndunduhʉn   hinakwaga   kʉma
       abu   -ga   zhingui -ru   ʉndundu   -hʉn   hin -akwa -ka   kʉma
       mother-Erg   the.same-Top   undeveloped -like grow -Obg -Prtc InfW

       kekwá
       kai -kuá
       say -FP

       'The mother told him that he would have to be reborn and grow again.'
       (Literally: 'This same mother told him that he would have to become
       formless and grow again.')

Similarily, **du** 'WO' can be used with **-shi** 'Caus' to mean 'to cause to break';
literally 'to cause to lose form'.

(64) ranzhe menaga   shimbunkwanzhe tera durushi
      ra -zhe mena -ga shimbunkua -zhe tera du- du -shi -i
      1s -Poss woman-Erg chicken   -Poss egg WO- WO -Caus -Ger

      awanugín   inkishushega
      u -a -nuk -ʉ -in   ʉnkʉ- i-   shush -ega
      do -Pfv-be -Wit -CK PossR- upon- fry -Pur

      'My wife was breaking the eggs in order to fry them.'

'To decay' and 'to fall apart' both involve loss of orientation or form. Example (65) utilizes the form **duma** (**du** 'WO + **-ma** 'ON') which literally means 'that which has lost form/order'.[7] **Kʉnduma** is literally 'rotten wood', but because it is a prototypical example of a structured substance falling apart, it has come to mean 'rotten' in a generic sense.

(65) kʉn   kʉnduma
      kʉn   kʉn- du -ma
      wood   wood- WO -ON

      'rotten wood'

(66) ranzhiduganzhe   suzu kʉma kʉnduma neka   awá.
      ra- zhi- duga -zhe   suzu kʉma kʉnduma nek   -ka u -á
      1s- Poss- brother-Poss bag InfW rotten   become -Prtc do -Pfv

      'My brother's bag has become rotten.'

Du is often used to describe something that goes against established norms. A figurative extension of this is the sense 'to be crazy'. Anyone who knows the importance of adhering to cultural norms and yet does not follow them is considered 'crazy'. The metaphorical extension appears to be that such people serve no useful purpose in the society—they are without a social 'orientation'; or represent a 'decomposition' of cultural values. The form **duma** (**du** 'WO' + **-ma** 'ON') means 'crazy' in Damana.

---

[7]There is a strong cultural value 'orientation and form are good; lack of orientation and formlessness are bad'.

(67) ranzhingwiaru uganzana awashka duma neshi
ra -zhi- guia -ru uganzana u -ashka duma nek -i
1s- Poss- brother-Top snarl/growl do -when crazy become -Ger

ukaye neka ni
u -ka -ie nek -ka na -in
do -Prtc -like become -Prtc be -CK

'My older brother when he snarls and growls is becoming like he is crazy.'

Talking in one's sleep is not seen as constructive or serving any purpose.

(68) ra kuma kuwa awangashka duma neshi augaye.
ra kuma kuua u -unga -ashka duma nek -i u -uga -ie
1s InfW sleep do -1sFut -when crazy become -Ger do -1sPrtc -like

'When I talk in my sleep, I become like I am crazy.'

'To play' goes against structured norms, serves no function, and is derived from **du**. In Wiwa society, play is not allowed. **Kub-** 'UnsAg' is used with **duma** 'that which has lost form' because it would be against common sense to actively try to 'lose form'. The form **dumegub** (**du** 'WO' + **-ma** 'ON' + **-ai** 'Advzr' + **-n** 'Actvzr' + **-kub** 'UnsAg') means 'to play'.

(69) Jason zhinzhoma tshwí aunugín Jeff
Jason zhinzhoma tu -i u -un -nuk -u -in Jeff
Jason book see -Ger do -Impf-be -Wit -CK Jeff

dumegubi aunugín
dumegub -i u -un -nuk -u -in
play -Ger do -Impf-be -Wit -CK

'Jason is reading (book seeing); Jeff is playing.'

Du 'WO' is also extended to mean 'to destroy'. This is another example of losing form. The form **durtshi** (**du** 'WO'+ **du** 'WO' + **-shi** 'Caus') means 'to beat to pieces'. The implication with this verb is that form is being completely lost. This can be applied to animate as well as inanimate objects and is not limited to 'fabric-like' objects.

In example (70), **zi-** 'careful' implies that the fruit was beaten enough to wrinkle (to make it soft enough to eat) but wasn't smashed and ruined.

(70)   ranzhingumaga   mangu antukaya nunka   gaiga
       ra- zhi- guma -ga   mangu antukaya nun -ka ga -ega
       1s- Poss- son   -Erg mango not.ripe be -Prtc eat -Pur

       careful- beat   -Ger do -Impf-be   -Wit -CK

       'My son in order to eat the green mango, is beating it (to soften it up).'

Du 'WO' is also extended to the aging process which is seen as the body losing form. Losing form is evidenced by the skin becoming wrinkled. **Zindurkub (zi-** 'careful' + **du** 'WO' + **du** 'WO' + **-kub** 'UnsAg') means 'to wrinkle with age'.

(71)   ranzhe menanzhe uburataru   zindurkumanunka
       ra -zhe mena -zhe uburata -ru   zindurkub-a -nun -ka
       1s -Poss woman-Poss cheek   -Top wrinkle -Pfv-be -Prtc

       ni   utuna neshi
       na -in utuna nek   -i
       be -CK old   become -Ger

       'My wife's face is wrinkled, she is becoming old.'

In example (72), the house once had a definite spatial orientation and form but is now losing both form and orientation. The use of **-kub** 'UnsAg' conveys that the formless nature of the house is the result of age, not the result of the actions of an agent.

(72)   uraga zara dwakumunté   nugín.
       uraga zara du -kub -unte nuk -u -in
       house old WO -UnsAg -Cont be -Wit -CK

       'The old house is in the process of falling down.' (Literally: 'losing form')

Du is also extended using the metaphor 'the body is a container' to mean 'to be full' or ' to be congested'. The connection seems to be the lack of inherent shape of the

liquid mass inside. This concept can be used for a stopped up nose (see below), or a
container full of honey.

(73) ranzhe ʉruama sigaru ʉnʉmʉna anduakubi
ra -zhe ʉruama siga -ru ʉnʉmʉna a- du -kub -i

u -ʉn -nuk -ʉ -in ʉnʉmʉna a- mʉt -i nuk -ame
do -Impf-be -Wit -CK congested 3sIO-enter -Ger be -because

'My child is congested (thick stuff running down) because he has the flu.'

In Table 5 the metaphors and extensions of **du** 'WO' are summarized. The
extended meanings are based on 'to lack form'. In this sense, **du** is distinctive because
extensions are based on 'formlessness' which may be considered to be a property of the
noun. Nevertheless, it would be difficult to explain how **du** could classify a 'noun class'
since all shapes of objects can be used with this verb in the various extensions.
Practically all of the extensions have to do with the pervasive cultural norm that
form/orientation is equivalent to 'usefulness'.

Table 5 Spatial Relation: du '(be) without orientation'

Expression	Sense	Basis for extension
undundu be without form	be undeveloped	lack of form/orientation
durushi to cause to lose form	to break	lose form/orientation
kunduma wood that has lost form	rotten	form/function is good; lack of form/function is bad
duma that which has lost form/function	be crazy	form/function is good; lack of form/function is bad
dumegub to exist without form/function	to play	form/function is good; lack of form/function is bad
zindurtshi to carefully cause to lose form	to beat (e.g. fruit)	formless is soft/flexible
zindurkub to exist losing form slowly	to age (wrinkle)	form/function is good; lack of form/function is bad
dwakub to exist with lost form	to disintegrate	form/function is good; lack of form/function is bad
andwakub to exist inside without form	to be congested	body is a container
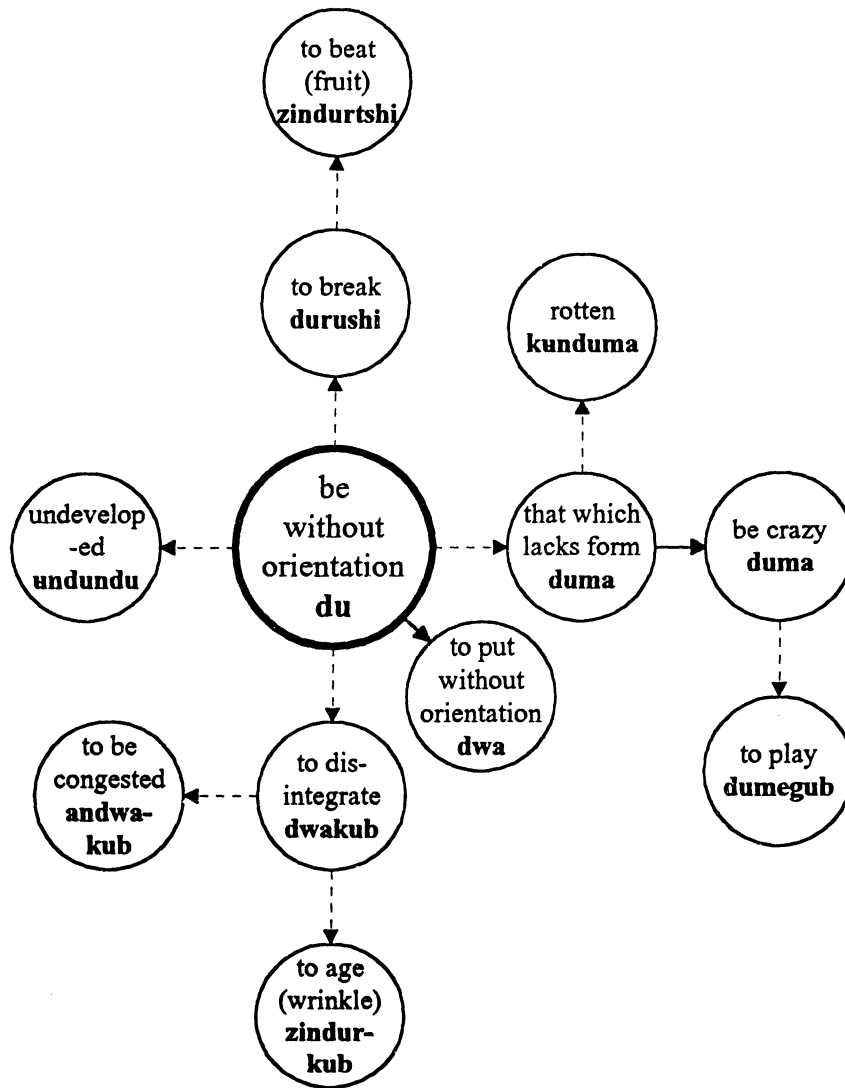

Figure 4   du '(be) without orientation'

5.5   Zhu '(be) distributed'

Zhu '(be) distributed' (distr) is extended not from any inherent shape but from the spatial relation 'to be distributed'. This concept is extended in the description of a spotted dog. In the following example, **anzhunuka**, literally means 'many things being distributed all over inside'.

(74) ranzhe   uragaka   nabionkura gunukaru
      ra -zhe uraga -ka nabionkura gu-   nuk -ka -ru
      1s -Poss house -at dog   DefLoc- be   -Prtc -Top

      anzhunuka   nukununka   ni.
      a- zhu -nuk -ka nu-   ku- nun -ka na -in
      in-distr -be   -Prtc 1sDO- Ben- be   -Prtc be -CK

      'The dog that I have living at my house is spotted.'

The concept of multiple entities distributed over a location, **Rinzhu (ri-** 'OblR' +
zhu 'distr'), leads to the sense 'to live together in a crowded condition'. This literally
means 'entities distributed over each other' and is conventionalized to mean 'to be
together'.

(75) ranzhe   kungumargaru   bugwi shiká
      ra -zhe kunguma -ru -ka -ru bugui shika
      1s -Poss earth   -Top -at -Top many people

      rinzhunukurga   tshikwaga   ni.
      rinzhu -nuk -ka -ru -ka dzhi- kua -ka na -in
      together -be   -Prtc -Top -at 3pS- exist -Prtc be -CK

      'In my land, there are so many people that they live crowded together.'

Zhu 'distr', when affixed with the locative prefix **i-** 'upon', is typically used for
sprinkling salt or sugar.

(76) rema nungu inzhú.
      rema nungu i   -zhu
      meat salt   upon-distr/Pfv

      'He salted the meat.'

This implies a relationship of 'over', which can be extended using the metaphor
'having control or force is up; being subject to control or force is down'. The one who is
in control is, of course, deemed more important. **Inzhu (i-** 'upon' + **zhu** 'distr') can
mean 'to control' or 'to be in charge' in Damana. Here again, what is being extended is
tne spatial relationship 'over' and not the shape of mass objects.

(77) umba   kungumaba   inzhu nugaki   ku
u -ba   kunguma -ba inzhu nuk -aki ku
here-Obl earth   -Obl control be -Lim all

guminshánunka   gwazi.
guminsh -á   -nun -ka guazi
beat   -Pfv -be -Prtc Intens

'Here on earth he is over (controls) everything and has defeated everything.'

The following example exploits the sense of 'to be in charge' as an extension of 'to be over'. Interestingly, in example (78), the hen is not over anything in the literal sense.

(78) ranzhe shimbunkwa sindumizhi inzhu   naya   uwín.
ra -zhe shimbunkua sindumizhi i-   zhu nai -a u -in
1s -Poss chicken   chicks   upon-distr go -Pfv do -CK

'My hen took (her) chicks (that she was in charge of) and left.'

Table 6 summarizes the previous examples:

                                      inzhu
```
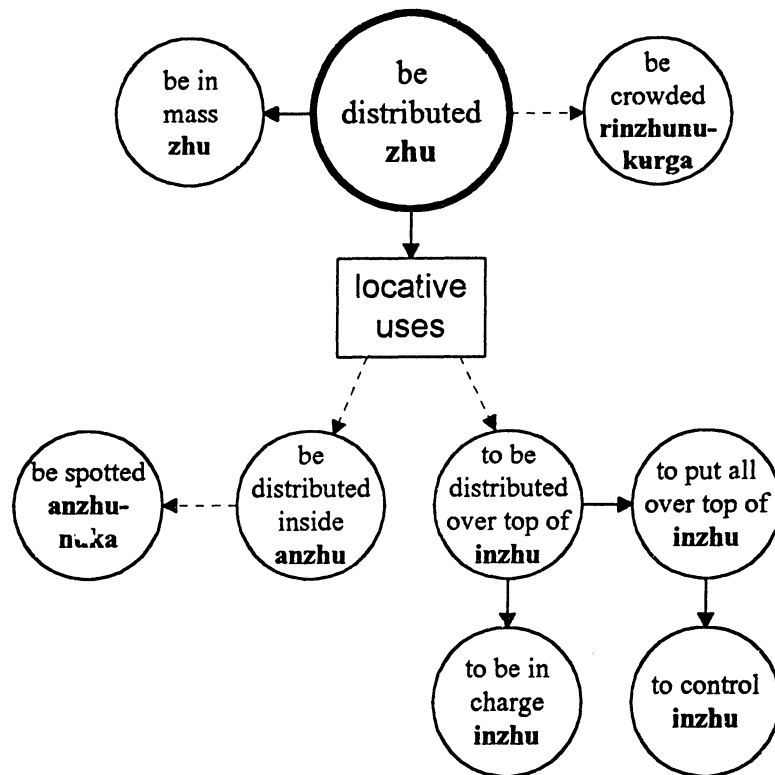

Figure 5   zhu '(be) distributed'

This chapter has shown that the verbs in Table 1 use a spatial orientation to extend in metaphor. Verticality (**te**), horizontal (**gag**), covered/closed (**pa**), and distributed (**zhu**) are the spatial relations and orientations that are central in extensions using these verbs. **Du** is a possible exception in that it is a nominal quality of formlessness that is extended; however, I maintain that **du** can not define a noun class because nouns of all shapes can lose their form and be used with this verb. Although the verbs in this chapter are the clearest cases of verbs in Damana that could appear to correspond to shape, the semantic analysis illustrates that the verbs categorize aspects of events and states (e.g. spatial relations and orientations) rather than inherent properties of objects. The categories created by the verbs and illustrated with the figures have as their core sense a spatial relation. Assuming that the core sense, that which is extended in

metaphor, captures what is encoded in the verb, then it is an orientation or spatial relation, not shape, at its core. Shape is relevant only as it corresponds to the respective orientations. In Chapter 6 other verbs are presented for which an associated shape is not readily assigned, however, they exhibit similar extensions and encode spatial relations.

CHAPTER 6
OTHER SPATIAL RELATION VERBS AND THEIR METAPHORICAL EXTENSIONS

This section illustrates that spatial relations and their extensions are not an exclusive property of the so called noun class verbs in Chapter 5, but rather they comprise just a small part of an overall strategy in the language of encoding spatial relations in the verbal system. This chapter further supports Mithun (1989) by showing that what these verbs categorize are verbal qualities such as spatial relationships in events and states rather than shapes or inherent properties of nouns.

In Damana, there are other verbs that describe other spatial relations, yet their lexical form is generally independent of an object's shape. They, therefore, cannot be associated with any nominal classification system. These verbs are used freely in metaphorical extensions in ways similar to the 'noun class' verbs. I claim that the two sets of verbs together form a natural group that expresses spatial relations. Some of these verbs are: **yu** '(be) inserted', **bi** '(be) hung arched', **soz** '(be) snagged', **we** '(be) apart', **ma** '(be) wrapped', and **pe** '(be) open'.

6.1   Yu '(be) inserted'

In Chapter 2, I mentioned that analyzing spatial verbs as part of a noun class system resulted in classes like 'things with holders' in Ika. The Damana verb **yu** '(be) inserted' generally expresses the spatial relation of 'to be down in' and is comparable to **zhu** in Ika, which Frank (1990) claims is used for 'things with holders'. Examples (79) and (80) illustrate this. Prefixed with **zhi-** 'OblR' and the causative suffix **-shi**, **yu** 'be inserted' is used for the action of inserting ones own feet into shoes or legs into pants. The 'things with holders' in Frank's analysis would be pants and shoes.

(79) ra ksokwa zhiyushi   awanukún.

ra	ksokwa	zhi-	iu[1]	-shi	-i	u	-ʉn	-nuk	-ug
I	shoe	OblR-	inserted	-Caus	-Ger	do	-Impf	-be	-1sS

'I was putting my shoes on.' (Literally: 'I was causing myself to be inserted into the shoes.')

(80) ʉná kʉrasuna zhiyushi   awanugín.

ʉná	kʉrasuna	zhi-	iu	-shi	-i	u	-ʉn	-nuk	-ʉ	-in
he	pants	OblR-	inserted	-Caus	-Ger	do	-Impf	-be	-Wit	-CK

'He was putting on his pants.'

However, **yu** can be used with any object to mean 'be inserted', not just those that prototypically have holders. In fact, it is often associated with one-dimensional objects, which makes two verbs that could 'classify' that shape, (the other one being **gag** '(be) horizontal'). Example (81) shows that **yu** is also used for putting on a ring.[2]

(81) ra anillo nʉyushi   awanukún.

ra	anillo	na-	iu	-shi	-i	u	-ʉn	-nuk	-ug
1s	ring	1sIO-	inserted	-Caus	-Ger	do	-Impf	-be	-1sS

'I was putting my ring on.' (Literally: 'I was causing the ring to be inserted to/on me.')

In stative uses, when something has been inserted, what is typically expressed is the spatial relation of 'down in'. Added to this are connotations that what has been inserted is under or inside something else, with part of the inserted item sticking out. If something is inserted and part is not showing, there are other verbs that are then used to mean 'be in'. **Yu** is used to describe the situation resulting from putting a pencil in the hair to hold it, as in (82).

---

[1]Although the analysis of the phonology has not been finalized, there are clear cases of /i/ and /u/ going to [y] and [w] respectively, and therefore I assume all surface [y]'s and [w]'s are underlying /i/'s and /u/'s.

[2]It appears that items that go on the body and encircle it, such as a ring, a watch, or a blanket, are referenced with indirect object agreement to probably denote possession while items such as hats, shoes, and clothes are referenced with **zhi-** 'oblique reflexive' (OblR).

(82) lapi   shamunkumba miyú   awamʉnugín.

lapi	shamunku-ba	mi-	iu	u	-ʉn	-mʉ	-nuk	-ʉ	-in
pencil	head	-Obl	2sIO-inserted/Pfv	do	-Impf	-2sS	-be	-Wit	-CK

'You put your pencil in your hair.' (Literally: 'You have inserted your pencil in your hair.')

Because glasses have parts that can 'be inserted' under the hair and over the ears, **yu** is used to describe wearing glasses.[3]

(83) ranzhe umaru   zʉdua   nʉkʉndununʉnka

ra	-zhe	uma	-ru	zʉdua	nʉ-	kʉ-	dun	-un	-nʉn	-ka
1s	-Poss	eye	-Top	well	1sDO-	Ben-	serve	-Neg	-be	-Prtc

name   kʉma anteojo niunuka   ni.

na	-ame	kʉma	anteojo	nʉ-	i-	iu	-nuk	-ka	na	-in
be	-because	InfW	glasses	1sDO-	upon-	inserted-be		-Prtc	be	-CK

'Because I do not see well, I wear glasses.'

In example (84), **yu** '(be) inserted' could be glossed as 'be wedged under' as it is describing the position of the stick. The concepts 'down in', 'under', 'part hidden' and 'part sticking out' are all evident.

(84) ukwémʉndzhi   kunejuga   ʉngina kʉn **yu**

u	-kua	-i	-mʉndzhi	kuneju	-ga	ʉngina	kʉn	iu
do	-FP	-Ger	-from	rabbit	-Erg	rock	wood	inserted

yuntshá   kʉma ukwá

iun	-shi	-á	kʉma	u	-kuá
go.down	-Caus	-Pfv	InfW	do	-FP

'After the rabbit had inserted the stick under the rock, (he) made it (the rock) go down.'

Yu is used in cases where the object being 'inserted' will not fit completely inside the referenced container. In (85), the objects put inside the bag stuck out the top.

---

[3]If the person would refer to wearing glasses like, 'having glasses on my face', **pa** '(be) flat' would be used to convey the sense of 'cover eyes'.

(85) suzumba   kʉn   kʉyu   kayaru   nekurzhi.
     suzu -ba   kʉn   kʉ- iu   kaia -ru   ne -kuzhi
     bag -Obl   wood   at- inserted after -top go -Hor

'After the wood is in the bag, let's go.'

This connotation of 'to be in but not completely out of sight' is exploited in
example (86) indicating that the wood put on the fire was big enough that the fire or the
flames did not engulf it.

(86) giemba   kʉn   kayu   murangwazi   zhakonega.
     gie -ba   kʉn   kʉ- a- iu   mʉra -guazi zha-   kon   -ega
     fire -Obl   wood   at- in-inserted/Pfv quickly -Intens UnsO- cook -Pur

'He put the big wood in the fire to cook the food very quickly.'

The spatial relation 'to be in but not completely out of sight' is common in the
culture. Bag-like objects are used to carry everything, even very young children. The
most common use of yu is with a dʉmbʉru (a dried gourd used to store the lime needed
in chewing coca leaves). Men always carry a dʉmbʉru, and when it is not in use, it can
be seen sticking up out of their bag.

(87) manzhe   dwadumba   dʉmbʉru   kʉyu   ushí
     ma -zhe   duadu -ba   dʉmbʉru   kʉ- iu   u -shi
     2s -Poss   bag   -Obl   gourd   at- inserted do -caus

'Put your gourd inside your bag!'

(88) shikaga   dwadumba   dʉmbʉru   kayu   naya
     shika -ga   duadu -ba   dʉmbʉru   kʉ- a- iu   nai -a
     person -Erg bag   -Obl   gourd   at- in- inserted go -Pfv

nushín
nuk -in
be -CK

'The person is carrying his dʉmbʉru in a bag.'

Because **yu** 'inserted' has an associated direction, when suffixed with **-n** 'Actvzr' it yields the motion verb 'to go down'.

(89)   ranzhemaru   gegurga   mundzhi yuná
        ra- zhi- ema   -ru   gegu -ru -ka mundzhi iun   -á
        1s- Poss- bro.in.law -Top Sierra -Top -at from   go.down -Pfv

        kamukerga   yum zhanduna inkishanun.
        kamuke -ru   -ka yum zhanduna unku- ishan -un
        plain   -Top -at corn seed   PossR- buy   -Impf

        'My brother-in-law came down from the Sierra to the plain to buy seed corn.'

Yu 'inserted' is extended in metaphor on the basis of the spatial relation of 'down in' and the interaction of objects which are located 'down in'. The combination of **ri-** 'OblR', and **-kub** 'UnsAg' extends the sense of 'to be down in' to 'many things existing down in', that is 'to be mixed together'. This implies a container.

(90)   raga   ingwi uruama siga   gumaga   ga ukweru
        ra -ga ingwi uruama siga   guma -ga ga u -kua -i   -ru
        1s -Erg one   spirit   progeny snake -Erg eat do -FP -Ger -Top

        tshiwa kungwi riukumanunka   akawa
        tshiua ku -gui riukub -a -nun -ka a-   kau -a
        grass all -Emph mixed -Pfv-be -Prtc 3sIO- give-Pfv

        ukugin
        u -kug   -in
        do -1sFP -in

        'I gave a child that a snake had bit a mixture of all the classes of plants.'

A further extension is the sense 'to cooperate' or 'to exchange ideas'. The basis of extension is the container schema where the people are the parts mixing together. 'To cooperate' is then literally '(a group of people) being mixed together in a given situation'.

(91)   shika   wiwandzhinaru   suntaru winun
          shika   uiua   -dzhina -ru   suntaru uinun
          people Wiwa -PL   -Top   outsider wit'ı

          rindzhiyukubi   dzhuwin.
          ri-   dzhi- iu   -kub   -i   dzhi- u -in
          OblR- 3pS- inserted -UnsAg -Ger 3pS- do -CK

          'The Wiwa and the white men are exchanging ideas.'

The participial form **yunga** (**yu** 'inserted' + **-n** 'Actvzr' + **-ka** 'Prtc') is derived to designate a river mouth—the point to which a river 'goes down'. This utilizes metonymy 'means for end' and a nominalization.

(92)   ukweru   nayánunkwa   dzhira yungamba.
          u -kua -i   -ru   nai -a   -nan -kua dzhira iunka   -ba
          do -FP -Ger -Top go -Pfv -be -FP   water river.mouth -Obl

          'And so he had gone to the river's mouth.'

The gerund form (**yuzhi**) of the motion verb **yun** 'go.down' (**yu** 'inserted' + **-n** 'Actvzr') means 'steep slope'. Here the motion of a person descending such a slope is used to represent the slope itself.

(93)   umba mundzhiru   yuzhi   zhuni.
          umba mundzhi-ru   iuzhi   zhan -in
          here   from   -Top steep.slope be   -Ck

          'From here it is a steep slope.'

Utilizing 'the body is a container', the sense 'to go down in' is extended to a transitive sense 'to swallow'.

(94)   gumaga   tshukkwí ayuná   awánunka.
          guma -ga tshukkuí a- iun   -á   u -á   -nun -ka
          snake -Erg rat   in- go.down -Pfv do -Pfv -be -Prtc

          'The snake swallowed the rat.'

The causative of this sense is used when making a child swallow something like medicine. It is also used to mean 'to turn down the volume', based on the metaphor 'up is loud, down is soft'.

(95) ranzhe ʉruama sigamba bebia riunshi
ra -zhe ʉruama siga -ba bebia ri- iun -shi -i

menamba riunshi ʉgwiá.
mena -ba ri- iun -shi -i ʉgui -á
woman -Obl OblR- go.down -Caus -Ger tell -Pfv

'It was during one day that a person had come to see me and when he came, the tape player had been turned on really loud and I told my wife to turn it down.'

Word formation processes also use these verbs. 'To sew' is literally 'to cause string to be inserted'. This uses the means to represent the end.

(97) raga   shi   yushuga
      ra -ga   shi   iu   -shi   -uga[4]
      1s -Erg   string   inserted -Caus -1sPrtc

'I sew (i.e. I know how to sew)'

'To sew' is extended to mean 'to warn' in Damana. The religious leader, when performing a divination or a religious rite over a person often ties (sews) a string around the wrist of the patient as a physical symbol of the spiritual work. This religious rite is normally done before a person embarks on a trip or undertakes an important task. The string represents the religious leader's teaching and becomes part of the person. These teachings are often warnings about what not to do and they seem more like threats. This has been conventionalized as 'to warn'.

(98) ranzhingumiga   ranzhe mena   shi
      ra- zhi- gumi   -ga   ra -zhe mena   shi
      1s- Poss- Mother.in.law -Erg 1s -Poss woman string

      ayushi   ra   winun kwawinunka.
      a- iu   -shi -i   ra   uinun kua -aui -nun -ka
      3sIO- inserted -Caus-Ger 1s with exist -NAP -be   -Prtc

'My mother-in-law is warning my wife that she should not live with me.'

Another derived form is **unkuyunukurga** 'pocket'. The Wiwa do not have pockets in their clothes; instead they use bags to carry small possessions. This word must be fairly recent, showing that spatial relations are utilized productively in word formation and metaphoric extension.

(99) unkuyunukurga
      unku- iu   -nuk -ka -ru -ka
      PossR- inserted -be   -Prtc -Top -at

      'pocket'   (Literally: 'place for inserting one's own things')

---

[4]Damana uses the participle for habitual aspect.

Table 7 summarizes the metaphorical uses of yu shown above:

Table 7 Spatial Relation: yu '(be) inserted' (Down in)

Expression	Sense	Basis for extension
riukumánunka existing down in with respect to each other	be mixed together	one action (insert) represents several similar actions (mix-insert several items in same container)
riukub to exist down in with respect to each other	to cooperate/ exchange ideas	people as ingredients of mixture
yunga down goer	river mouth	means (going down) for end (place of arrival)
yuzhi going down	steep slope	personification
ayun to go down inside	to swallow	body is a container
riunshi to cause to go down in oneself	to make swallow	body is a container
	to turn volume down	up is loud; down is soft

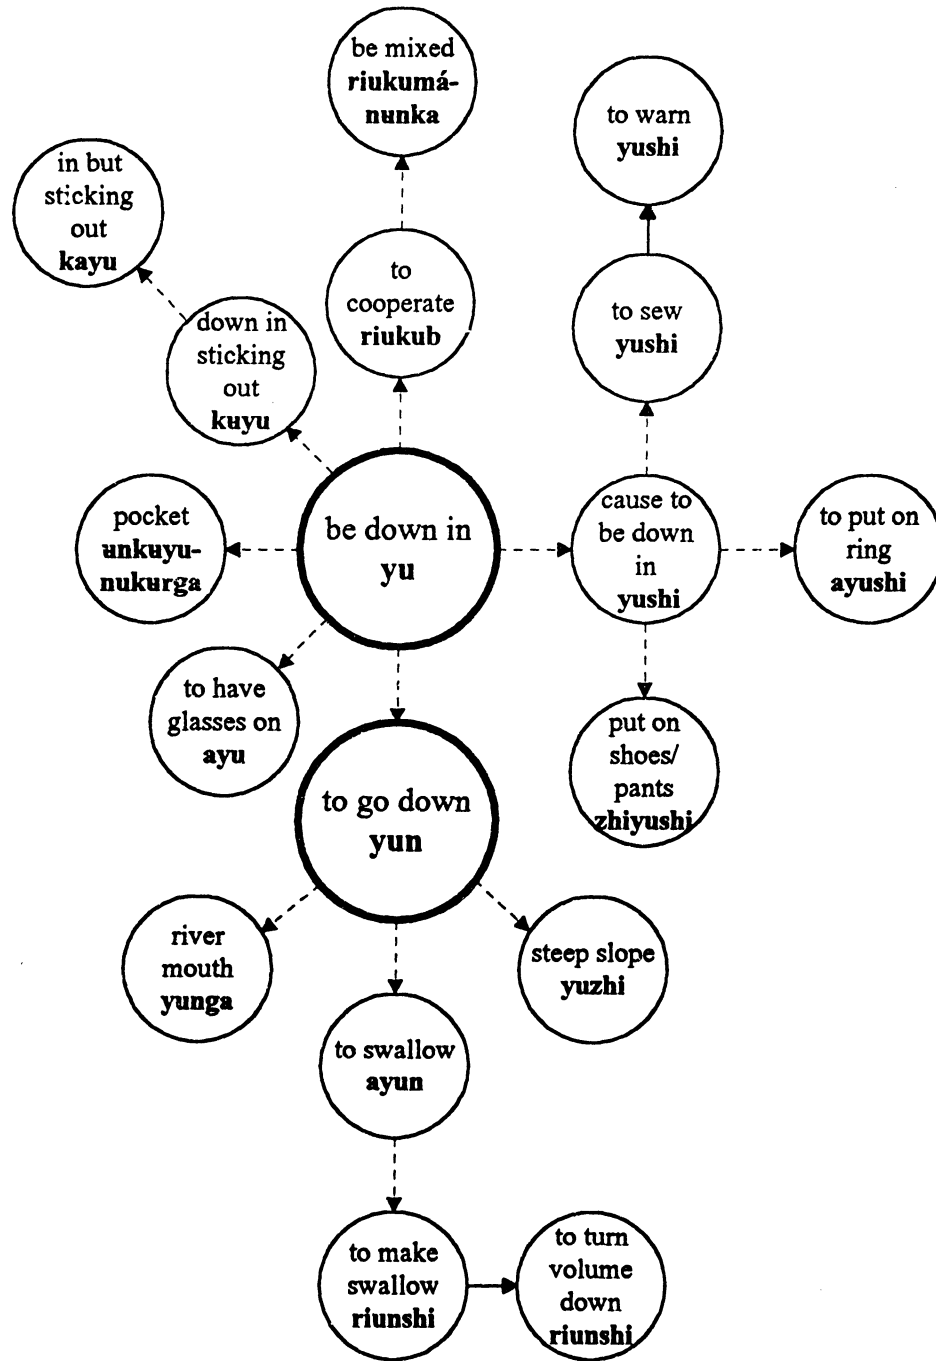

Figure 6   yu '(be) inserted'

6.2   Bi '(be) hung arched'

The verb **bi** '(be) hung arched' expresses that a long flexible object is draped over a central point so that the resulting overall shape is that of an arc.[5] Because of its nature, this verb is often associated with 'fabric-like' objects or at least something that is flexible as in example (100).

'After my older sisters killed the snake, they hung it over a tree limb.'

'To wear clothes' uses **bi** 'be hung' because equal parts are 'hanging' in the front and back forming the symmetrical shape of an arc. Voiced stops in Damana are prenasalized in appropriate contexts, therefore 'to have clothes on' is **imbi** (**i-** 'upon' + **bi** 'hung.arched'). There is a connotation that since the clothes 'hang' on the person, they are considered to be too big.

(101)   munkusara imbi
     munkusara i-   bi
     clothes   upon- hung.arched

'He has big clothes on.'

If clothes are not specifically mentioned, the normal interpretation would be some fabric-like object draped over a person's shoulder.

---

[5]This word is also the word for century plant, which has this overall shape with its large curved leaves.

         'It was yesterday that I washed the clothes and then hung them over the string to dry.'

Ri- 'OblR' with **bi** '(be) hung arched' indicates ' to be hung on itself' and is used to mean 'to tangle'. This hindrance sense can be extended to mean 'to trip' or 'to get one's feet tangled up'.

Bita (**bi** 'hung arched' + **-ta**[6] 'upright') can also mean 'crown (of a head)'. This appears to superimpose an imaginary arc hanging over the head, and refers to the apex of the arc where it hangs over the head.

     'I hit the top of my head hard getting in the car.'

The addition of **-n** 'Actvzr' to **bi** yields the meaning 'to go in the shape/direction of an arc', 'to go up and then down' as over a hill. When the Wiwa are headed to a specific destination, they use specific verbs such as 'to go up' or 'to go down'. **Bin**, however, involves motion going up and going down, and has been conventionalized to mean 'to wander'. Some of the sense of **bin** may also be extended from the inactivity of 'hanging'. When the Wiwa go somewhere just to say they have been there, to visit, or to acquaint themselves with the area, **bi** is used. This is similar to the English 'to hang out' or 'to hang about'.

---

[6]-**Ta** appears to be a variant form of **te** 'upright'.

        'Both of them are coming to visit us, David also.'

Bi is used to describe a baby's first walk. It is also used to describe the aimless wanderings of animals; the connection being the element of 'purposelessness'. However, all motion encoded by **bi** would not have to be purposeless or aimless, since there is also an element of 'to go in a weaving motion (horizontal arcs)' such as the motion of a fish swimming.

(109) raru   bizhi   awanukún   undua

'A fish is swimming in the water.'

The idea 'to be hung from a point in a symmetrical fashion' is extended to 'to

wind string around the big toe. This is how a strap is made for a bag and uses the

metaphor 'means for end'. 'Making the strap hang' is used to represent the process of

winding string in order to make the strap.

(112) ranzhabuga   sustshina bishi

     i-   zhi- te   -shi -unka
     upon- 3pS- upright -Caus -Fut

'My mother is making a strap. It will be put on my bag.'

With **u-** 'portative', **bi** '(be) hung arched' means 'to lead', in the sense that the

thing guided has no control (no purpose) over where it goes (an animal or a person who

---

[7]Before /i/, /zh/ and /r/ are allophones.

does not know the area). **Umbinshi** (u- 'Por' + **bi** 'hung.arched' + **-shi** 'Caus'), then, builds both on the sense 'hung' (turned horizontal in a guide rope for an animal) and the lack of purpose of the one being led.

(113)   buru   shimbumba   umbinsha
            buru   shimbun -ba umbinshi -a
            donkey rope   -Obl lead   -Pfv
            'He led the donkey.'

The spatial relationship of 'to be in front' combined with the sense of 'to lead' or 'to guide' implies dominance. The relationship of being at the 'head' of the animal goes along with the sense of dominance and power. With the metaphor 'having control is to be in front; being subject to control is to be behind', **umbinshi** means 'to win', 'to reign', or 'to dominate'.

(114)   umbinsha   sana
            umbinshi -a   san   -a
            lead   -Pfv   go.out -Pfv
            'He will never let him win.' (Literally: 'Never let him lead.')

Umbinshi has the conventionalized meaning 'to make go'. This form is extended from 'to lead/guide' to refer to parents who have the responsibility for guiding their children. What is being extended is the authority of the one leading and neither the position of being in front nor the guide rope are present. **Umbinshi** in (115) still has the sense of 'to lead/guide' in that the child has no control but is merely accompaning his mother wherever she is going. Parents use this form when they are trying to get their children to stay close to them on the trail.

(115)   abuga   gumuntshina umbinshi   nugín.
            abu   -ga   gumuntshina u- bi -n   -shi -i   nuk -u -in
            mother -Erg child   Por-hung -Actvzr -Caus -Ger be -Wit -CK
            'Mother is making the child go.'

Even in its use with animals, it has been conventionalized to the extent that neither a rope nor the position of being in front have to be present.

Figure 7   **bi '(be) hung arched'**

6.3   Soz '(be) snagged'

Another spatial relationship is denoted by the verb **soz**. Its gloss '(be) snagged' implies 'to obtain by pursuing and grasping'. When contact is involved, it is being grasped or snagged with fingers, a hook, or a claw.

(117) dumagaga   conejo so   kuma ukwá   gayiega
       dumaga-ga conejo soz   kuma u -kuá ga -ega
       puma   -Erg rabbit snagged/Pfv InfW do -FP   eat -Pur

'The puma grabbed the rabbit (from behind with its claws) to eat it.'

The nominalized form of **soz** '(be) snagged' with **-ka** '3sPrtc' means 'fisherman' (literally, 'one who snags (with a hook)').

(118)   soska
        soz   -ka
        snagged -Prtc

        'fisherman'

A compound construction is formed from **soz** 'snagged' and **sewa** 'fish' to make 'fishing net'.

(119)   sewasozhi
        sewa-soz   -shi -i
        fish- snagged -Caus -Ger

        'fishing net'

With indirect object agreement prefixes, **soz** implies 'to hold a possession with fingers'.

(120)   zhinzhoma gogandzhina   winkuma   awashkuru   ragangwa
       zhinzhoma gau -ka -dzhina uinkub -a   u -ashka -ru   ra -ga -gua

       pencil 1sIO-snagged/Pfv book   make -1sFut -like

'When the ones who know how to write (book makers) are gathered together, I also, having taken hold of my pencil, will write like them.'

Because of the nature of **soz** '(be) snagged', which prototypically implies contact and movement, both the positional relationship between two objects (one closely behind another) as well as the snagging itself can be extended in metaphor.

Like **pa** '(be) flat', **soz** can also be used to mean 'to receive' as an extension of the sense 'to be snagged/grasped'. Here, again, the means represents the end result.

(121)   ra mena   guguní   nukugashkuru   dumburu

            ni
            na -in
            be -CK

            'When I had not taken a woman, I did not hold my gourd. Afterwards, when I took a woman, I received my gourd.'[8]

In example (122), there is a sense of 'to grab it back', that is 'to receive'.

(122)   abu   senuran kuna   ukwashkuru   matuna gura kukina
            abu   senuran kun -a   u -kua -ashka -ru   matuna gura ku- kin -a
            mother Senuran give -Pfv do -FP -when -Top Matuna arm Ben- fall -Pfv

            ukwashkuru   Shukwakuraga   ingwi risó.
            u -kua -ashka -ru   Shukuakura -ga   ingui ri- só
            do -FP -when -Top Shukwakura -Erg again OblR- snagged/Pfv

            'When mother Senuran (mother earth) was given to Matuna, his arm fell off, and when this happened, Shukwakura received her back again (grabbed her back).'

With **soz** '(be) snagged', what is received has to be something small enough to hold with the fingers.

---

[8]The use of the gourd is a fertility rite which is done only by married men.

(123) raga   ugwarugaru   ranzhdugaga   tera

       'I made my younger brother hold the eggs so they would not break.'
       (Literally: 'I am thinking that I should make my younger brother hold the
       eggs to prevent them from breaking.')

In prototypical use of **soz**, such as a predator chasing a prey, one animate thing is behind another. This relationship is extended with the end result used to represent the process itself (following). In (124), **soz** is used as an adverb describing the relative position of the two moving entities.

(124) dumagagaru   conehomba kusó   zhuariun kuma

         ʉnkʉ- soz   iun   -kug -in
         PossR- snagged go.down -1sFP -CK

         'I came down from Kemakumʉke with my family following closely behind.'

With regard to the sense 'to follow', culturally, the one who is ahead or in front has the higher status. It is a pervasive metaphor in Damana that high status is to be in front and low status is to be behind. A man, for example, walks in front of his family. Thus, **soz** is extended to indicate responsibility for the care of others. This could also be somewhat related to the metaphor 'having control is to be in front; being subject to control is to be behind'.

(128)   ranzhiguma   akwega

       'My small son, for whom I am responsible (who follows me), also lives
       here.'

The senses 'to follow' and 'to snag' are both exploited in the following use of

soz. The stripes on a woven bag that is composed of two colors is pictured as one color

following the other around the bag and snagging (catching) it on the other side. 'SO' in

the example indicates that the two stripes have the same orientation.

(129)   raga   ingwi dwadu nukununka   mema dwaduru

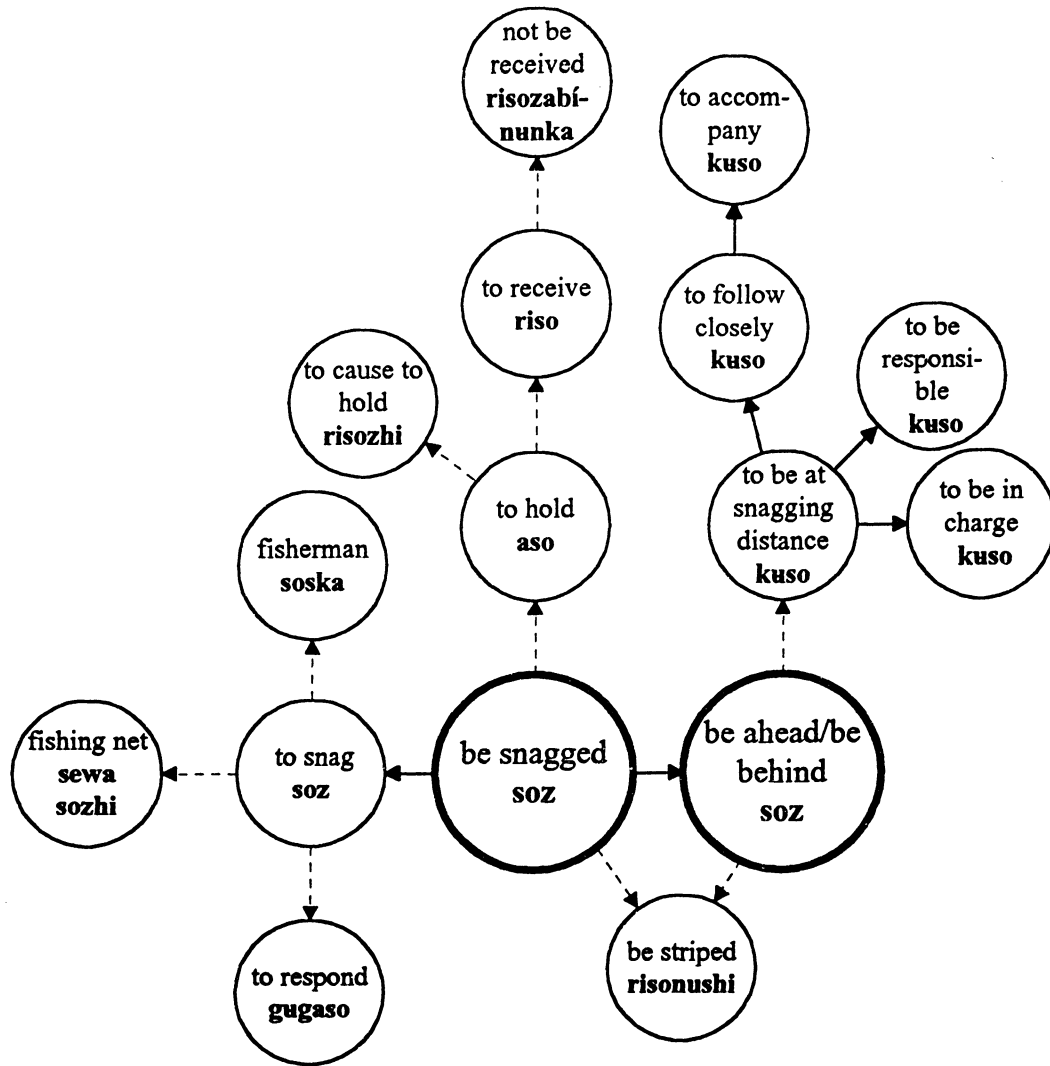

Figure 8   soz '(be) snagged'

6.4   We '(be) apart'

The spatial relationship between two objects which are not in contact is referenced by the verb **we** '(be) apart'. The shape of the objects is completely irrelevant; what is important is the gap between the two objects. In example (132), **we** references the gap between the birds and the ground. Reduplication indicates plurality.

(132)　we　　　we　　　na'i
　　　　ue　　　ue　　　nai -i
　　　　apart　apart　go -Ger

'(The birds) are flying.'

In example (133), the spatial relation **we** 'be apart' is used as an adverb of manner describing the space between two objects.

(133)　ranzhingumaga　　　shekunogwa kuwe　　nayunuka　　　kusa
　　　　ra- zhi- guma -ga　shekunogua　ku- ue　　nai -un　-nuk -ka　kusa
　　　　1s- Poss- son　-Erg　horse　　　at- apart　go -Impf-be -Prtc foot

　　　　kupashi　　　　ukwame.
　　　　ku- pash -i　　ukuame
　　　　Ben- hit　-Ger　prevent

'My son goes apart from the horse, to prevent being kicked.'

In the following example, **we** is used as a predicate adjective to describe the space between a door and a door frame.

(134)　guma　　kuwe　　nukwashkuru　　　　ranzhe　kunsinguma
　　　　guma　　ku- ue　　nuk -kua -ashka -ru　ra -zhe　kunsi -guma
　　　　opening　at- apart　be -FP -when -Top　1s -Poss dog　-Dim

　　　　nikinzhuariá.
　　　　nu- ki- zhuari -á
　　　　1sDO- Mal- run　-Pfv

'While the door was open, my puppy ran away on me.'

With **ri-** 'OblR', the space defined by **we** is between two parts of a single object. Below, **we** would mean 'open' as it refers to the space between the two sides of a bag.

(135) ranzhingwiaga   dwadu riwesha
   ra- zhi- guia -ga duadu ri- ue -shi -a
   1s- Poss- brother-Erg bag OblR- apart -Caus-Pfv

   ukwemundzhiru   dumburu awar.
   u -kua -i -mundzhi -ru dumburu auar
   do -FP -Ger -from -Top gourd take.out

   'My older brother opened his bag and took out the gourd.'

We is extended in metaphor. The causative form of **we** literally means 'to cause a gap'; when used in connection with starting a fire it means 'to fan'. This apparently refers to the smoke that is separated from the fire by fanning. The metaphor is end for means.

(136) sizi Lorenzoga gie wi ukwemundzhiru
   sizi Lorenzo -ga gie ui u -kua -i -mundzhi -ru
   friend Larry -Erg fire heat do -FP -Ger -from -Top

   weshi   nugwigweru   raga anzhe we.
   ue -shi -i nu- gui -kua -i -ru ra -ga anzhe ue
   apart -Caus-Ger 1sDO- tell -FP -Ger -Top 1s -Erg obey apart/Pfv

   'My friend Larry lit the fire and afterwards he told me to fan it and I obeyed and fanned.'

Weshi has been conventionalized and now just means 'to fan', whether or not separation is involved. To fan oneself requires **nun-** 'SO' (Shared Orientation).

(137) gwiandzhina wi wi amurashka   unanzhe
      guia -dzhina ui ui a-   mut -ia -ashka una -zhe
      brother-PL   heat heat 3sIO-enter -Med! -when 3s -Poss

      tutushomamba   nunweshi   nugín.
      tutushoma -ba nun- ue -shi -i   nuk -u -in
      hat   -Obl SO- apart-Caus -Ger be -Wit -CK

'When the older brothers are hot, they fan themselves with their hats.'
(Literally: 'When heat enters the older brothers, he[9] fans himself with his
hat.')

The next few examples illustrate the metaphorical extension of we using the

metaphor end for means. In example (138), we is used with a- 'in' to indicate the gap

between objects in a bounded area (container-like), in this case, the forest. Awe is used

to indicate that the small growth under the trees has been cut away, leaving cleared gaps

between the trees.

(138) ra kunkuna aweshi   nukun zharikungamba
      ra kunkuna a- ue -shi -i   nuk -ug zharikun -ka -ba
      1s forest in- apart -Caus-Ger be -1sS plant   -at -Obl

'I am clearing the forest where I will plant.' (Literally: 'I am causing the
trees to be apart (so that there is room) where I am going to plant.'

The sense of 'to have gaps' can also be used to mean 'to make room or space for

somebody', that is 'to get out of the way'.

(139) ungina yunwa   kuma awa   kuwekuma   ushi.
      ungina iun   -unua kuma u -a ku- ue -kub -a u -shi
      rock   go.down-Imn InfW do -Pfv at- apart -UnsAg -Pfv do -Caus

'A rock is starting to come down, get out of the way!'

The sense of 'to cause gaps to be made for someone' is derived to mean 'to sort

(separate in piles)'.

---

[9]In the main clause, the auxiliary **nugín** carries subject agreement which in this case is third person
singular, referencing the older brothers as a collective unit.

(140) ingwi suzumba   ekwegandzhina atshikwagaru   ranzheru

	to choose	end (have a gap) for means (to choose)
wekub to exist with gap between	to swim	end (gap from ground) for means (to swim)
	to fly	end (gap from ground) for means (to fly)
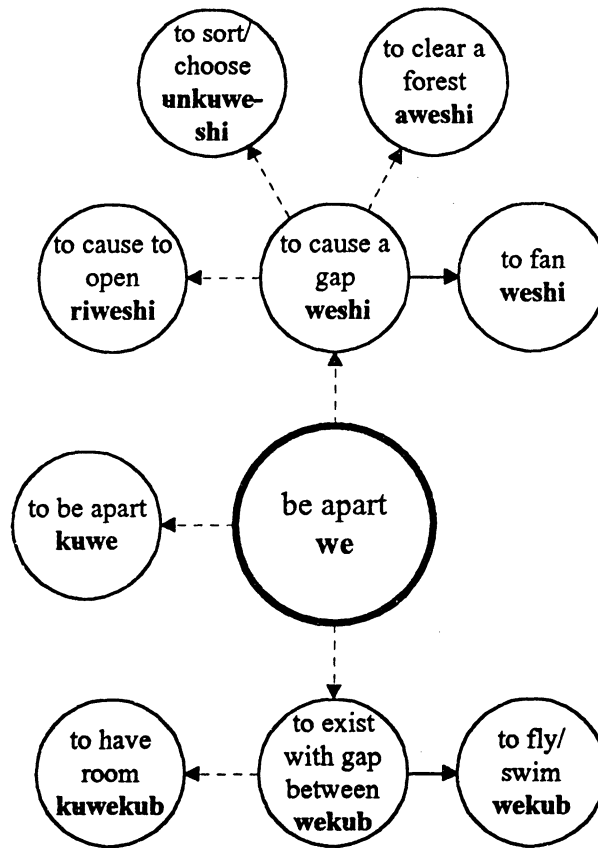

Figure 9   **we '(be) apart'**

6.5   Ma '(be) wrapped'

Several spatial relation verbs describe the bond between two objects. The verb ma '(be) wrapped' is used to describe the relationship 'to be wrapped around'. Two typical examples of ma are for a wrist watch around the wrist or a towel around the body.

(145) guramba rero   namanuka   ni   mama   dzhwisa
      gura -ba rero   na- ma   -nuk -ka na -in mama   dzhuisa
      arm -Obl watch 1sIO-wrapped-be -Prtc be -CK shaman sun

ᴜnkᴜpekumakin twanga.
ᴜnkᴜpekumakin tu   -ᴜnga
position   see -1sFut

'My watch is wrapped around (my) arm. (This way) I will see what time
it is (position of the sun god).'

(146) toaya namakwega
      toaya na- ma   -kua -ai   -ka
      towel 1sIO-wrapped -exist -Advzr -Prtc

'His towel is wrapped around him.'

With -ka 'participle', there is a nominalization of ma which means 'sheet' or

'blanket' ('that which is caused to be wrapped around oneself'). The abbreviation 'SO'

means shared orientation.

(147) nᴜmashka
      nᴜn- ma   -sh   -ka
      SO- wrapped -Caus -Prtc

'blanket/sheet'

The addition of -n 'Actvzr' produces the sense 'to go around something', a path

which is wrapped around a landmark. In cases with a definite agent, -shi 'Caus' is used.

(148) ranzhe   burugaru   kɯrapishi muntshi[10]
ra -zhe buru -ga -ru   kɯrapishi ma   -n   -shi -i
1s -Poss donkey-Erg -Top press   wrapped -Actvzr -Caus -Ger

      Intens do -1sMedl -CK

'During the night when I was cold, I wrapped myself in a sheet.'

The wrapping can be done in a figurative sense as in the following example where smoke is treated as a blanket.

(156) sutá   mimazhi   awashka   mawi.
      sutá   mi- ma   -n   -i   u   -ashka mau -i
      smoke 2sIO- wrapped -Actvzr -Ger do -when cry -Ger

'When smoke is wrapping around you, you cry.'

Within the Wiwa culture, the primary reasons for wrapping an object are to take it on a trip or to leave it behind in storage. Therefore, a logical interpretation of the causative form 'to cause to be wrapped' is 'to leave something behind'. All of the following derived forms that use the sense of 'to leave' or 'to remain' involve the metaphor means for end. Note that in example (157) this sense has been extended and what is left is a person with no meaning of being wrapped or bound.

(157) ranzhe ᴜruama sigandzhinaru   ranzhabu   nᴜn
      ra -zhe ᴜruama siga   -dzhina -ru   ra- zhi- abu   nᴜn

      eat -1sPrtc PossR- in-wrapped -UnsAg -Pfv do -Pfv-be -1pPrtc

      name.
      na -ame
      be -because

'Because we have married, my woman knows how I live and how I eat.'

Besides 'to be married', example (165) illustrates another extension; 'to become accustomed to'. After a prolonged existence in an area with something else, one becomes 'wrapped with it', or 'accustomed' to it. This expression is also used for becoming better acquainted, or becoming accustomed to the weather.

(166) makaru   mena   mukamukubiki
      ma -ka -ru   mena   mu-   ku- a- ma   -kub -i   -ki

      do -Impf -be -Wit -CK

'I have become accustomed to living in Santa Marta with the heat.'

Munshi nunka 'sweet', a nominalized expression, is an example of (ma

'wrapped' + -n 'Actvzr' + -shi 'Caus') (nun 'be' + -ka 'Prtc') being used in a metaphor

means for end. 'Sweet' is extended from 'that which has been caused to go around'

because sugar is extracted from sugar cane using a sugar cane press, a machine which

requires walking in a circle for a long period of time (see example 145). Sweet and tasty

are interchangeable senses in Wiwa culture.

(168) musaru   muntshi nunka ni.

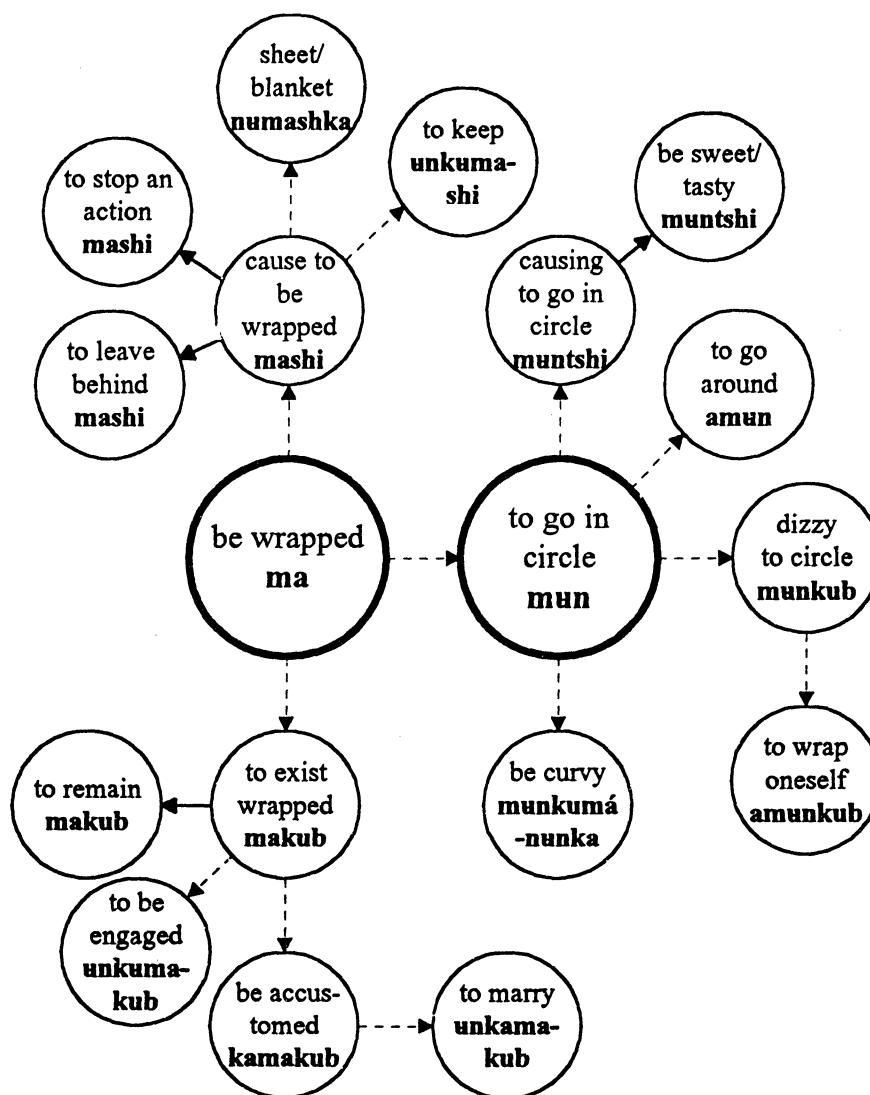

Figure 10   ma '(be) wrapped'

6.6   Pe '(be) open'

Another verb which refers to a spatial relationship is **pe** '(be) open'. It conveys the opposite of **pa** '(be) flat' when it means 'to be covered' or 'to be sealed'. Because 'to be open' is normally associated with an enclosed space of some sort, **a-** 'in' (referring to the container) is frequently affixed to it.

(170) mawigaru uraga ape   mawankwemʉndzhiru

     upon- 3pS- open -Caus -Ger

'If a child, boy or girl, gets cut, the cut is opened by nurses (sickness see-
ers) in order to clean the dirt out.'

Associated senses of 'to be open' are the result of cultural factors. For example, a

Wiwa man wears his woven bag diagonally, across the opposite shoulder. In this way,

the opening of the bag is stretched tight against him, effectively closing it. In order to

open his bag, he must first remove it from his shoulder. Similar considerations apply to bags on pack animals. Here, the goal or end result (opening a bag) is used for the process or means to achieve it (removing it).

        2s- Poss- sister -Top garbage open -Caus be   -Fut   IndefFut

        'Your younger sister will someday remove the (pile of) garbage.'

Since the world is thought of as a container, it can be opened and shut. A ceremony done at a Wiwa funeral, 'the opening of the earth', involves the moving of dirt from one place to another (Reichel-Dolmatoff 1974). Since the floor of a Wiwa house is made of dirt, sweeping also involves the removal of the top layer. Therefore 'opening the earth' can mean 'to sweep' and is also used for chicken scratching.

(182) minduna   uyé   ra uragamba zhapeshi?

       3pDO- Ben- become -Prtc be

       'Women are sweepers in the house. In order to sweep they need a
       broom.'

When referring to a human being, **pe** means 'to be attentive'. This is based on

the body as a container metaphor, and is similar to the English expression 'to be open'.

(184) abugaru   imé   mugwiakwaga.   pe   neshi   kuma
       abu -ga -ru ime   mu- gui -akua-ka pe   nek   -i   kuma

       'Mother says to you like this, "Be attentive (and) people will never get
       upset with you".'

Table 12 Spatial Relation: pe '(be) open'

| Expression	Sense	Basis for extension
ishpeshi to cause to open upon	to clean a wound	means (to open) for end (to clean the wound)
kupe to open at	to remove (a shoulder bag)	end (to open a bag) for means (to remove it)
numpeshi to cause to open from self in same orientation	to dry oneself	means (remove water) for end (dry)
peshi to cause to be open	to pick up (fruit), (eggs), (garbage)	generalized use of 'removal' with other items
zhapeshi to cause (whatever) to be open	to sweep	earth is a container which can be opened by removal of dirt
zhapeshka one who causes (whatever) to be open	sweeper	earth is a container which can be opened by removal of dirt
zhapekuna part that opens	broom	earth is a container which can be opened by removal of dirt
pe neshi to cause to become open	to be attentive	body is a container, face (with its sensory organs) is its opening, information 'enters' the body
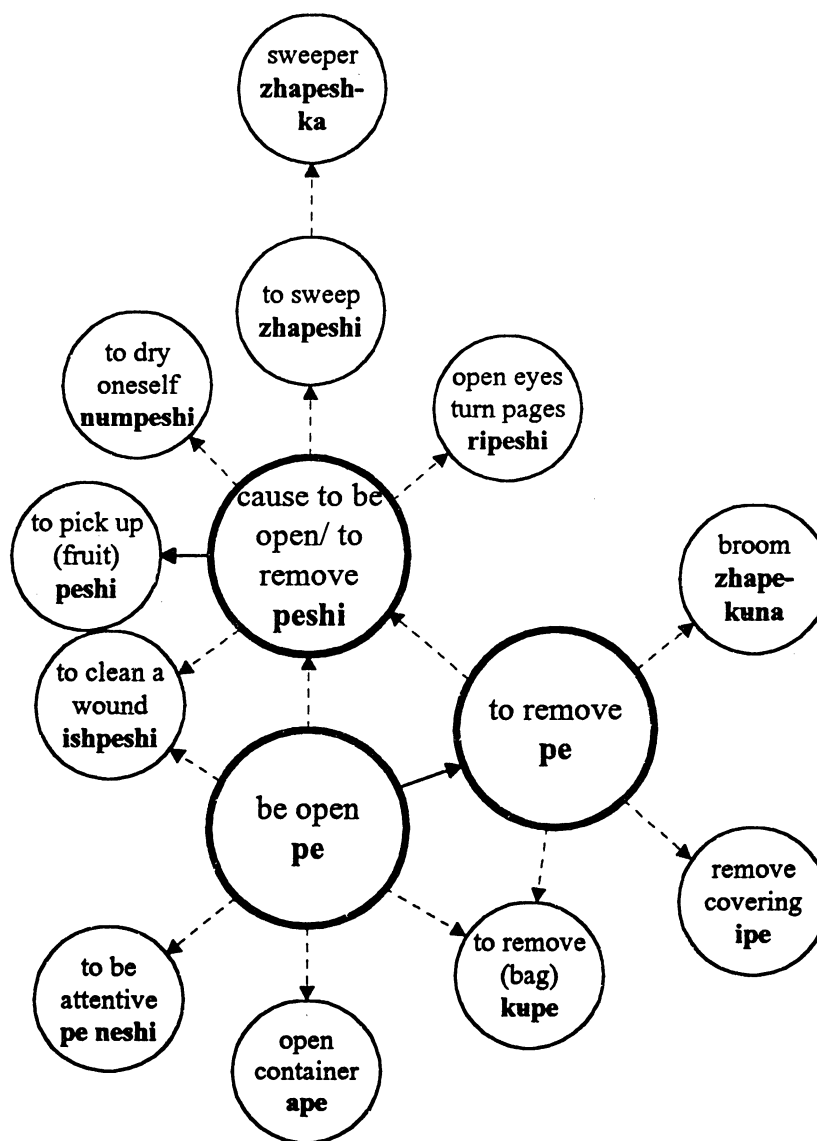

Figure 11   **pe '(be) open'**

It has been seen in this chapter that the encoding of orientation or spatial relations appears to be a characteristic of the verbal system in Damana. The verbs in this chapter have been shown to extend the following spatial relations: down in (**yu**), hung arched (**bi**), ahead/behind (**soz**), wrapped (**ma**), and open (**pe**). The verbs of Chapter 5 and 6 are

not different class verbs, but are part of a natural group of verbs in Damana that express spatial relations.

CHAPTER 7
CONCLUSION

I conclude that Damana does not have a nominal classification system. Aside from cases in which the placement of an object is in its prototypical orientation, there is little similarity between other nominal classification systems and the languages of the Sierra Nevada. Verbs do have selectional restrictions that are sensitive to properties that typically figure in noun class systems, but noun classes are not created by co-occurrence constraints between the noun and the predicate. Nouns are not exhaustively grouped into a small number of classes. Verbs do not encode inherent properties of nouns that could define classes. There is also a great deal of flexibility in what verb can be used with what shaped object, indicating that this is not a rigid grammaticalized classification. A variety of semantic factors play a role in the choice of verb for a particular object. A small group of verbs (those in Chapter 5) appear sensitive to shape, but that is only because certain shaped objects are more prone to be associated with certain orientations. In Damana, unlike languages with a nominal classification system, when a verb is used that does not agree with the prototypical orientation of the noun, there is no strange or novel interpretation, but just the description of the spatial orientation.

The categorization of spatial relations is a natural consequence of interaction with a physical environment. By means of a semantic analysis using patterns of metaphorical extension to illustrate core senses, I have shown that orientation verbs reference spatial relations and other verbal properties. The verbs in Chapter 6 show that it is a language tendency to encode spatial relations in the verbal system. The prototypical meaning of all the verbs discussed have at their core a spatial relation that is used as the basis for extensions; therefore, spatial relations are what is being categorized.

This thesis serves to demonstrate the beauty of human categorization and provides a glimpse into how one isolated group, the Wiwa, have categorized their world to better understand it.
